

TEXAS PARKS AND WILDLIFE

# BIRDS

OF

## MUSTANG ISLAND STATE PARK AND VICINITY

A FIELD CHECKLIST

2010

*Cover: Illustration of Piping Plover by Clemente Guzman III.*

# INTRODUCTION

**M**ustang Island State Park covers 3,954 acres of Mustang Island, a subtropical barrier island separating Corpus Christi Bay from the northwestern Gulf of Mexico. The only state park south of Galveston located directly on the Gulf, this park provides an opportunity to view habitats typical of the Texas Coastal Bend. These habitats include: open Gulf waters and 5.5 miles of beach, barrier island dunes and grasslands, and estuarine wetlands (bayside waters, marshes, and tidal flats). For more information about the ecology of Mustang Island, see *Down to Earth at Mustang Island* by Jay A. Raney and William A. White (2002, Bureau of Economic Geology).

The geographic area covered in this checklist includes all of Mustang Island, which is some 18 miles in length. This includes the city of Port Aransas, which has certain micro-habitats which are prime birding spots. These include the Leonabelle Turnbull Birding Facility, a boardwalk into a pristine marsh habitat, as well as the Scott and Joan Holt Paradise Pond, which features an observation boardwalk into a wooded freshwater pond. The latter is a valuable migrant trap, which produces a host of neotropical migrant songbirds. Also included in the checklist area is the extreme northern tip of Padre Island, which is seven miles south of the park. This area, known as Padre Isles, is the only portion of North Padre Island which is inhabited by people. The Packery Channel County Park and adjacent neighborhoods provide an opportunity to view many Trans-Gulf migrants as they stop briefly in the oak mottes there, or in the vegetated lawns of the residential areas on the island.

Located at the northern edge of the Tamaulipan biotic province, the park is most suitable for year-round observations of coastal waterbirds. Resident herons, egrets, ibises, gulls, and terns from nearby rookeries and nesting colonies are easily seen feeding or resting on the island's wetlands. With its relatively mild winter climate, this area is prime wintering grounds for many waterfowl and shorebird species. Large populations of loons, grebes, pelicans, cormorants, and ducks (especially Northern Pintails, American Wigeons, Redheads and Lesser Scaup) spend the winter in adjacent Corpus Christi Bay, the Gulf or on freshwater island ponds. During winter months, bayside tidal flats teem with shorebirds, ranging from oystercatchers, plovers, and curlews to sandpipers and godwits. More pelagic species can sometimes be observed along the Gulf beach or from the Port Aransas or Packery Channel jetties. Northern Gannets or jaegers are the most often encountered in winter; and Magnificent Frigatebird or, on rare occasions, a Masked Booby in summer.

Birds of prey also find the island a good wintering spot. Short-eared Owls have been found hunting over open grasslands. The utility poles down the center of the island make good perches for the occasional Peregrine Falcon and frequently for Ospreys, White-tailed Hawks and Red-tailed Hawks.

Situated on the Central Texas coast, Mustang Island is an excellent location for observing migrating birds that tend to concentrate along the coastline. On some days, the island acts as a "highway" for streams of migrating waterbirds and passerines. One then has only to sit and watch birds moving by! The beach and bayside trails show such dramatic increases in waterbirds that it is not uncommon to see large flocks of waterfowl, waders, shorebirds, or tern species traveling north during the spring and south during the fall. The same phenomenon is demonstrated by hummingbirds and passerines such as swallows.

Migrants are especially numerous and identifiable during passage of cold fronts, when inclement weather forces birds of all species down. Those that land in dunes and grasslands generally survive, while large kills occur in the Gulf, as evidenced by dead birds occasionally washed up along the beaches. During such "fall-outs," birding can be hectic but extremely rewarding. It is spectacular indeed to see a small bush containing Scarlet Tanagers, Baltimore Orioles, Rose-breasted Grosbeaks, and Indigo and Painted Buntings! And of course, there is always the chance for some unexpected rarity such as a Cape May Warbler, Western Tanager or Bobolink.

One should remember that the status of a species depends on the presence of suitable habitat. Because of the limited habitat types found within the park (either wetlands or grasslands), some species are not normally expected here, although they may be abundant on the mainland or in wooded habitats elsewhere on the island only a few miles away.

This checklist was compiled by Mel Cooksey of Corpus Christi. This edition of the checklist is based in part on the previous edition compiled by Tony Amos of Port Aransas. Checklist nomenclature and organization follows the American Ornithologist's Union *Checklist of North American Birds* (1998, 7th edition, 49th supplement, August 2008).

Because we will be updating this checklist as additional observations are made, we ask that you report details of new or unusual sightings. Bird sightings can be mailed to the Natural Resources Program, Texas Parks and Wildlife Department, 4200 Smith School Road, Austin, Texas 78744.

---

*Please help protect the natural avian communities in our parks by refraining from using playback tapes of bird songs. Frequent use of these tapes disrupts normal avian activity patterns, disrupts essential territorial behavior and may lead to nest failure. Thank you for your cooperation.*

---

## LEGEND

### Seasons

- Sp - spring (March - May)
- S - summer (June - August)
- F - fall (September - November)
- W - winter (December - February)

Note: Many species have an early fall migration, and may appear in our area as migrants during the summer season. For purposes of separating these species from those which are summer residents, we will indicate an \ in front of the abundance status. For instance, Least Sandpiper is designated as \C for summer, indicating that it is a common species during that period. Though Least Sandpiper is not a breeding bird, and would be rare in mid-summer, its numbers increase noticeably in late July and August as migrants and winter residents arrive.

### Abundance

- C - common - should be seen on 75 percent or more of trips in proper habitat and season
- F - fairly common - should be seen on 50 percent or more of trips in proper habitat and season
- U - uncommon - should be seen on 25 percent or more of trips in proper habitat and season
- R - rare - may be seen on 10 percent or more of trips in proper habitat and season
- X - accidental - only one or two records in the past ten years
- I - irregular - absent some years, but may be numerous in others

**Pelagic Birds:** Although certain species of pelagic birds may be fairly common in the western Gulf of Mexico, they are rarely encountered in the Mustang Island State Park vicinity. During and after storms, these birds are occasionally seen, sometimes washed ashore. Our understanding of Gulf of Mexico pelagic birds is far from complete. Listed here are species which have either occurred along the beaches of Mustang Island and nearby Padre Island or been seen from the beaches. Some of these represent storm-killed specimens found on beaches. We also list the species' presumed abundance status in the Western Gulf of Mexico.

## CITATION

Cooksey, Mel. January 2010. Birds of Mustang Island State Park and vicinity: a field checklist. Natural Resources Program, Texas Parks and Wildlife Department.

---

In 1983, the Texas Legislature created the Special Nongame and Endangered Species Conservation Fund. This fund may be used for nongame wildlife and endangered species research and conservation, habitat acquisition and development and dissemination of information pertaining to nongame management. Money for this fund is obtained through private donations and sale of nongame wildlife art prints and stamps. This fund now gives Texans a unique opportunity to help support this state's valuable and sensitive nongame resources. Your individual contributions and purchases of nongame art prints and stamps will help determine the level of nongame conservation activities in Texas. For more information call toll-free (1-800-792-1112) or contact: **Nongame and Endangered Species Program, Texas Parks and Wildlife Department, 4200 Smith School Road, Austin, Texas 78744.**
