SURVEY AND MANAGEMENT SUMMARY

Fish populations in Benbrook Reservoir were surveyed in 2009 with electrofishing and trap nets, and in 2010 using gill nets. This report summarizes the results of the surveys and contains a management plan for the reservoir based on those findings.

- **Reservoir Description:** Benbrook Reservoir is a 3,635-acre impoundment located on the Clear Fork of the Trinity River approximately 10 miles southwest of Fort Worth. Water level fluctuates widely in the reservoir. Benbrook Reservoir has consistently been eutrophic. Habitat consisted of standing timber and rocks.
- **Management history:** Important sport fish included white bass, palmetto bass, largemouth bass, white crappie, and catfish. The management plan from the 2005 survey report included stocking palmetto bass at 10 fish/acre annually. Largemouth bass have historically been managed with state-wide minimum length limit of 14 inches. Florida largemouth bass were introduced in the mid-to-late 1970s and stocked again in 2007. Blue catfish were stocked in 1990 and 1991 to capitalize on the abundant prey base. Recent efforts to improve the fish habitat and angler success have included construction of brush-piles in various locations.
- **Fish Community**
 - **Prey species:** Threadfin shad continued to be abundant. Electrofishing catch of gizzard shad was high. Electrofishing catch of bluegills and longear sunfish was much lower than in previous surveys. The reservoir was approximately 5 feet above conservation pool when the electrofishing survey was conducted which made it difficult to get to the bank.
 - **Catfishes:** The channel catfish catch rate nearly doubled from the previous sample. Blue catfish numbers in Benbrook Reservoir declined from the previous sample.
 - **Temperate basses:** White bass, yellow bass, and palmetto bass were present. White bass were collected at a higher rate than in previous years. Yellow bass, which may have been introduced through a pipeline connecting Cedar Creek Reservoir to Benbrook Reservoir, were collected in gill nets for the first time 2006 and continued to be abundant. Palmetto bass abundance remained good over the past two surveys.
 - **Largemouth bass:** Largemouth bass were captured in low abundance. Only one fish over 14 inches was collected. Largemouth bass body condition was poor.
 - **Crappies:** Size and body condition of white crappie continued to be good, and abundance was much higher than the previous sample. Black crappie were sampled for the first time since 2001, but in low numbers.
- **Management Strategies:** Stock palmetto bass at a rate of 10/acre annually. Conduct standard sport fish monitoring in 2013-2014 with an additional electrofishing survey in 2010, and an additional gill netting survey in 2012. Attempt habitat improvements through water willow plantings.

INTRODUCTION

This document is a summary of fisheries data collected from Benbrook Reservoir in 2009-2010. The purpose of the document is to provide fisheries information and make management recommendations to protect and improve the sport fishery. While information on other species of fishes was collected, this report deals primarily with major sport fishes and important prey species. Historical data are presented with the 2009-2010 data for comparison.

Reservoir Description

Benbrook Reservoir is a 3,635-acre impoundment constructed in 1952 on the Clear Fork of the Trinity River. It is located in Tarrant County approximately 10 miles southwest of Fort Worth and is operated and controlled by the United States Army Corps of Engineers (USACE). Primary water uses included municipal water supply (controlled by Tarrant Regional Water District [TRWD]) and recreation. Benbrook Reservoir was listed as hypereutrophic with a mean TSI chl-*a* reading of 58.24, which was slightly higher than the 2004 sample (Texas Commission on Environmental Quality 2008). The primary habitat at time of sampling consisted of rocks and standing timber. No aquatic vegetation was observed during the habitat survey. Water level has been highly variable since 1999, and in subsequent years the water level has reached 10 or more feet below conservation pool (Figure 1). Tarrant Regional Water District began drawing more water from Benbrook Reservoir (Clear Fork) for municipal uses in 2005 to reduce the demand on the West Fork of the Trinity River Reservoirs (e.g., Bridgeport, Eagle Mountain, and Worth). Boat access consisted of 16 public boat ramps within six public parks, but can be extremely limited when water levels are low. Bank fishing access was available at Holiday Park, Mustang Park, Rocky Creek Park, and Longhorn Park. Other descriptive characteristics for Benbrook Reservoir are in Table 1.

Management History

Previous management strategies and actions: Management strategies and actions from the previous survey report (Hungerford and Brock 2006) included:

1. Maintain a quality palmetto bass fishery through annual stocking.
Action: Palmetto bass have been stocked annually at a rate of 10 fish/acre since the early 1990s, except in 2000 and 2001 due to golden alga toxins at TPWD fish hatcheries. Subsequent gill netting surveys have indicated these stockings have been successful. An annual creel survey in 2001 revealed 12% of anglers were seeking palmetto bass.
2. In 2006, water levels rose to conservation pool after a significant period of low water inundating terrestrial vegetation.
Action: Florida largemouth bass were stocked at a rate of 50/acre.
3. Drastic water level fluctuations have persisted at Benbrook since 1999. Low water levels in 2005 along with collaboration with TRWD and the USACE allowed us to build and place several brush piles made of recycled Christmas trees.
Action: Subsequent visual inspections of the brush piles revealed their longevity was poor; they were essentially gone in 6 months. The low return for the effort expended caused us to discontinue the plan. Planting water willow was also discussed, but never was performed because we were unable to identify a good source of transplants.

Harvest regulation history: Sport fishes in Benbrook Reservoir are currently managed with statewide harvest regulations (Table 2).

Stocking history: Benbrook Reservoir has been stocked periodically since the early 1990's and annually since 2002 with palmetto bass. Threadfin shad were introduced in 1984, blue catfish in 1990, and Florida largemouth bass in 1974; these species were still present in the reservoir. The complete stocking history

is in Table 3.

Vegetation/habitat history: No aquatic vegetation was found in Benbrook Reservoir during the 2009 habitat survey. Historically, native emergent aquatic vegetation (cattail and water willow) was present (Brock 2002). Drastic water level fluctuations since 1999 are likely the cause for the disappearance.

Water Transfer: Benbrook Reservoir is primarily used for municipal water supply, recreation, and to a lesser extent, flood control. There is currently one permanent pumping station on the reservoir which connects to a raw water treatment plant for municipal use. There is also an outfall from a pipeline operated by TRWD that transfers water to Benbrook Reservoir from Richland Chambers and Cedar Creek Reservoirs in East Texas. According to TRWD staff, the water is mixed with approximately 66.7% Richland Chambers water and 33.3% from Cedar Creek.

METHODS

Fishes were collected by electrofishing (1 hour at 12 5-min stations), gill netting (5 net nights at 5 stations), and trap netting (5 net nights at 5 stations). Catch per unit effort (CPUE) for electrofishing was recorded as the number of fish caught per hour (fish/h) of actual electrofishing and, for gill and trap nets, as the number of fish per net night (fish/nn). Due to excessively low water levels during the fall of 2005, electrofishing was not conducted at Benbrook Reservoir because access was not available. All survey sites were randomly selected and all surveys were conducted according to the Fishery Assessment Procedures (TPWD, Inland Fisheries Division, unpublished manual revised 2008).

Sampling statistics (CPUE for various length categories), structural indices [Proportional Size Distribution (PSD), as defined by Guy et al. (2007)], and condition indices [relative weights (W_t)] were calculated for target fishes according to Anderson and Neumann (1996). Index of vulnerability (IOV) was calculated for gizzard shad (DiCenzo et al. 1996). Relative standard error (RSE = 100 X SE of the estimate/estimate) was calculated for all CPUE statistics and SE was calculated for structural indices and IOV. Ages were determined using otoliths. Source for water level data was the United States Geological Survey website with cooperation from the Fort Worth District of the United States Army Corps of Engineers.

RESULTS AND DISCUSSION

Habitat: Littoral zone habitat consisted primarily of natural and standing timber (Table 4). Large water level fluctuations beginning in 1999 have been detrimental to the littoral habitat in Benbrook Reservoir. Native emergent vegetation (cattail and water willow) was present prior to drastic water level fluctuations.

Prey species: Electrofishing catch rates of gizzard shad were 288.0/h in 2006 and 207.0/h in 2009. Index of vulnerability (IOV) for gizzard shad was excellent, indicating that 95% of gizzard shad were available to existing predators; this was higher than IOV estimates in previous years (Figure 2). Total CPUE of gizzard shad was slightly lower in 2009 compared to the 2006 survey but higher than the 2003 survey (Figure 2). Electrofishing catch rate of threadfin shad was 787.0/h. Total CPUE of bluegill in 2009 was only 21.0/h, which is much lower than the previous surveys (Figure 3). Longear sunfish total CPUE was 12.0/h in 2009 which is much lower than the previous two surveys (Figure 4). The reservoir was 4.7 feet above conservation pool making it difficult to sample the shoreline because terrestrial vegetation obstructed our path. With the exception of the sunfishes in 2009, Benbrook Reservoir continued to support an excellent forage base.

Catfishes: Flathead catfish are present in the reservoir as one individual was collected in 2009-2010. The gill net catch rate of blue catfish was 1.4/nn in 2010 (Figure 5). This CPUE is approximately half that of the previous two surveys. Relative weights of blue catfish were good in 2006 and 2008. Because of the relatively low catch rate, only one blue catfish was weighed from the 2010 sample. Several small

individuals were collected indicating natural reproduction. Total CPUE of channel catfish was 7.2/nn in 2010, which is more than double the 2006 and 2008 surveys (Figure 6). Relative weights of stock-size (11 inches) channel catfish were generally above 90.

White bass: The gill net catch rate of white bass was 7.6/nn in 2010. This CPUE was much higher than the previous two (Figure 7). Nearly all fish collected were legal for harvest and relative weights were around 100.

Palmetto bass: The gill net catch rate of palmetto bass was 3.8/nn, down from the historic high of 8.4/nn in 2006, but similar to the catch rate in 2008. Mean relative weights were generally between 90 and 100 (Figure 8). Growth of palmetto bass was good with fish reaching 18 inches in 2 to 3 years (Figure 9).

Largemouth bass: The electrofishing catch rate of largemouth bass in 2009 was 32.0/h. As was the case with the sunfish species, the high water levels encountered during the fall electrofishing survey in 2009 made the sampling conditions less than ideal. Flooded terrestrial vegetation blocked us from accessing the water level and we ultimately were sampling deeper water than usual. The electrofishing catch rate of largemouth bass was 120.0/h in 2006 and 66.0/h in 2003. Catch rate of largemouth bass over 14 inches remained low, with only 1 individual collected in 2010. A ten-year high of 9 individuals were collected in 2006, and 3 individuals were observed during the 2003 survey. So few fish were sampled in 2009 that relative weight calculations were meaningless; however, the mean relative weights of nearly all sizes of fish in 2006 were good, ranging between 90 and 110. It appears the varying water level is, at the very least, affecting our ability to collect adequate and consistent electrofishing data, and could potentially be influencing the abundance of the largemouth bass population. Florida largemouth bass influence has remained relatively constant as Florida alleles have ranged from 48.3% (1999) to 63.0% (2009) and the pure Florida genotype has ranged from 0.0 to 19.2% (Table 5). Procedures for genetic analysis changed from testing one to two allozymes in the early 2000s to testing micro-satellites in 2007. This could explain the drop in the pure Florida genotype.

Crappie: The trap net catch rate of white crappie was 11.0/nn in 2009, much higher than in 2005 (2.0/nn) and higher than in 2001 (8.6/nn). The PSD was 98 which was higher than the PSD in 2005 and higher than the PSD in 2001 (Figure 11). Mean relative weight was around 90 for all size classes in 2009. Four black crappie were collected during the 2009 trap net survey.

Fisheries management plan for Benbrook Reservoir, Texas

Prepared – July 2010.

ISSUE 1: Palmetto bass continue to provide a quality fishery in Benbrook Reservoir. However, the fishery has to be maintained through stocking.

MANAGEMENT STRATEGIES

1. Stock fingerling palmetto bass (10/acre) annually based upon actual surface area.
2. Conduct gill net surveys every other year to monitor growth, relative abundance, and condition of palmetto bass.

ISSUE 2: Recently, the Tarrant Regional Water District (TRWD) has modified their policy of drinking water distribution resulting in drastic water level fluctuations at Benbrook Reservoir. In addition, drought conditions have amplified the effects of the water level. In the winter of 2005, the water level reached a historic low of 14 feet below conservation pool. The potential detrimental impact on habitat with these water level fluctuations is great. Collaboration among TRWD, U.S Army Corps of Engineers, and TPWD to enhance aquatic habitat (brush-pile construction) during low water levels was successful; however effectiveness was short-lived due to the rapid deterioration of the material used.

MANAGEMENT STRATEGY

1. Request water willow from new TPWD aquatic plant nursery site in Athens for test planting in several shoreline areas. If test plots are successful, the strategy will be expanded to other portions of the reservoir.

ISSUE 3: Many invasive species threaten aquatic habitats and organisms in Texas and can adversely affect the state ecologically, environmentally, and economically. For example, zebra mussels (*Dreissena polymorpha*) can multiply rapidly and attach themselves to any available hard structure, restricting water flow in pipes, fouling swimming beaches and plugging engine cooling systems. Giant Salvinia (*Salvinia molesta*) and other invasive vegetation species can form dense mats, interfering with recreational activities like fishing, boating, skiing and swimming. The financial costs of controlling and/or eradicating these types of invasive species are significant. Additionally, the potential for invasive species to spread to other river drainages and reservoirs via watercraft and other means is a serious threat to all public waters of the state.

MANAGEMENT STRATEGIES

1. Cooperate with the controlling authority to post appropriate signage at access points around the reservoir.
2. Contact and educate marina owners about invasive species, and provide them with posters, literature, etc... so that they can in turn educate their customers.
3. Educate the public about invasive species through the use of media and the internet.
4. Make a speaking point about invasive species when presenting to constituent and user groups.
5. Keep track of (i.e., map) existing and future inter-basin water transfers to facilitate potential invasive species responses.

SAMPLING SCHEDULE JUSTIFICATION:

The proposed sampling schedule includes an additional electrofishing survey in the fall of 2010, gill netting in spring of 2012, and standard monitoring in 2013/2014 (Table 6). Gill net surveys will be conducted every other year to monitor the palmetto bass fishery.

APPENDIX A

Number (N) and catch rate (CPUE) of all species collected from all gear types from Benbrook Reservoir, Texas, 2009-2010.

| Species | Gill Netting | | Trap Netting | | Electrofishing | |
|------------------|--------------|------|--------------|------|----------------|-------|
| | N | CPUE | N | CPUE | N | CPUE |
| Gizzard shad | 139 | 27.8 | | | 207 | 207.0 |
| Threadfin shad | | | | | 787 | 787.0 |
| Common carp | 46 | 9.2 | | | | |
| River carpsucker | 8 | 1.6 | | | | |
| Blue catfish | 7 | 1.4 | | | | |
| Channel catfish | 36 | 7.2 | | | | |
| White bass | 38 | 7.6 | | | | |
| Yellow bass | 59 | 11.8 | | | | |
| Palmetto bass | 19 | 3.8 | | | | |
| Bluegill | | | | | 21 | 21.0 |
| Longear sunfish | | | | | 12 | 12.0 |
| Largemouth bass | 1 | 0.2 | | | 32 | 32.0 |
| White crappie | 8 | 1.6 | 55 | 11.0 | | |
| Black crappie | 1 | 0.2 | 4 | 0.8 | | |
| Freshwater drum | 9 | 1.8 | | | | |

APPENDIX B

Location of sampling sites, Benbrook Reservoir, Texas, 2009-2010. Trap net, gill net, and electrofishing stations are indicated by T, G, and E, respectively. Boat ramps are indicated with a B. Water level was 3.6 feet above full pool at time of trap netting, 1.4 feet above full pool at time of gill netting, and 4.7 feet above full pool at the time of electrofishing.

Appendix C

Historical catch rates of targeted species by gear type for Benbrook Reservoir, Texas.

| Gear | Species | Year | | | | | | | | | | | | | | |
|----------------------------------|-----------------|-------|-------|-------|-------|-------|-------|-------|------|-------|------|------|------------|------|------|-------|
| | | 1987 | 1989 | 1991 | 1993 | 1996 | 1999 | 2001 | 2002 | 2003 | 2004 | 2005 | 2006 | 2008 | 2009 | 2010 |
| Gill Netting (fish/net night) | Blue catfish | 0.1 | 0.1 | 0.0 | 0.0 | 0.6 | 1.0 | | 0.6 | | 0.8 | | 3.8 | 3.0 | | 1.4 |
| | Channel catfish | 7.0 | 12.0 | 4.0 | 3.8 | 3.5 | 3.0 | | 1.6 | | 6.8 | | 3.4 | 3.0 | | 7.2 |
| | White bass | 28.0 | 11.0 | 18.0 | 23.8 | 13.8 | 14.4 | | 8.6 | | 11.5 | | 3.0 | 1.4 | | 7.6 |
| | Yellow bass | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | 0.0 | | 0.0 | | 0.0 | | 4.4 | 13.2 | | 11.8 |
| | Palmetto bass | 0.0 | 1.0 | 0.0 | 1.4 | 6.0 | 9.4 | | 2.4 | | 1.8 | | 8.4 | 4.4 | | 3.8 |
| Electrofishing (fish/hour) | Gizzard shad | 311.0 | 139.0 | 177.0 | 394.0 | 131.0 | 272.0 | 256.0 | | 192.0 | | | 288.0 | | | 207.0 |
| | Threadfin shad | 518.0 | 243.3 | 523.0 | 298.0 | 29.0 | 224.0 | 232.0 | | 464.0 | | | 1089. 0 | | | 787.0 |
| | Bluegill | 277.0 | 346.0 | 165.0 | 104.0 | 27.0 | 41.0 | 194.0 | | 253.0 | | | 276.0 | | | 21.0 |
| | Longear sunfish | 191.0 | 207.3 | 277.0 | 0.0 | 19.0 | 28.0 | 97.0 | | 151.0 | | | 145.0 | | | 12.0 |
| | Redear sunfish | 30.0 | 80.0 | 15.0 | 5.3 | 2.0 | 0.0 | 0.0 | | 3.0 | | | 0.0 | | | 0.0 |
| | Largemouth bass | 145.0 | 314.0 | 159.0 | 127.3 | 72.0 | 125.0 | 72.0 | | 66.0 | | | 120.0 | | | 32.0 |
| Trap Netting (fish/net night) | White crappie | 3.0 | 3.0 | 2.8 | 5.0 | 2.6 | 2.6 | 8.6 | | | | 2.0 | | | | 11.0 |
| | Black crappie | 0.0 | 0.0 | 1.0 | 0.4 | 0.6 | 0.2 | 0.2 | | | | 0.0 | | | | 0.8 |
