Austin, Texas 78744

## ACKNOWLEDGMENTS

We thank each member of the Texas Parks and Wildlife Department Coastal Fisheries staff who conscientiously collected and recorded all data. Jeff Doerzbacher and Maury Ferguson summarized all data. C. E. Bryan, Gary Saul, Tom Heffernan, Ed Hegen, Lynn Benefield and Hal Osburn provided valuable editorial comments. This study was conducted with partial funding from the U.S. Department of Commerce: National Oceanic and Atmospheric Administration, National Marine Fisheries Service, under P. L. 88-309 (Project 2-400-R) and the U.S. Department of Interior, Fish and Wildlife Service, under D.J. 15.605 (Project F-34-R).

## ABSTRACT

Trends in relative abundance and size of brown shrimp (Penaeus aztecus), white shrimp (P. setiferus), pink shrimp (P. duorarum), blue crab (Callinectes sapidus), and Eastern oyster (Crassostrea virginica) in Texas marine waters were monitored using a standardized fishery independent sampling program with bag seines along bay shorelines, trawls in bay water  $\geq$  1.0 m deep and in Gulf water  $\geq$  1.8 m deep within the Texas Territorial Sea and oyster dredges in bay "reef" and "non-reef" areas. Brown shrimp catch rates generally increased in bag seines during 1977-1985 and in bay trawls during 1982-1985. White shrimp catch rates in both gears generally declined during the same years. Pink shrimp catch rates declined in bag seines but were similar among years in bay trawls. Catch rates of blue crabs increased in both bag seines and bay trawls. Catch rates of associated finfishes in trawls varied among years. Highest catches of market oysters in Galveston Bay occurred during September-December.

## INTRODUCTION

The commercial fishery in Texas is composed of many components but reported landings are dominated by shrimp (Penaeus sp.) followed by blue crab (Callinectes sapidus), Eastern oyster (Crassostrea virginica) and finfishes (Osburn et al. 1985). During 1977-1984 shrimp coastwide annual reported landings averaged 37 million kg worth \$156 million to the fishermen; they consisted of 68.8% brown (P. aztecus) and pink (P. duorarum) shrimps, 31.0% white shrimp (P. setiferus) and < 0.2% other species (Osburn et al. 1985). Eastern oyster and blue crab coastwide annual reported landings averaged 1.4 million kg (\$4.5 million) and 3.6 million kg (\$2.2 million), respectively, during 1977-1984 (Osburn et al. 1985).

The shrimp fishery is regulated primarily by the Texas Legislature through the Shrimp Conservation Act. In addition, the Texas Parks and Wildlife (TPW) Commission has the responsibility for adjusting the Gulf shrimping season dates and has regulatory authority in four of the 18 coastal counties. The TPW Commission has regulatory authority for the harvest of blue crab in all Texas waters and for the harvest of oysters in 10 of the 18 coastal counties. In 1985, the Texas Legislature provided the TPW Commission regulatory authority for the harvest of shrimp and oysters in all Texas waters after shrimp and oyster management plans are developed by the Texas Parks and Wildlife Department (TPWD) and approved by the TPW Commission.

The Texas Legislature mandated that sound management of the shellfish resources be based on statistically reliable data. Penaeid shrimp populations have been monitored in at least some bays since 1958 (Benefield and Baker 1980). Oyster populations have been monitored in Galveston Bay since 1951 (Hofstetter 1977). Blue crab populations have been monitored since 1977 (Hammerschmidt 1982). The TPWD initiated a standardized fishery-independent monitoring program in 1975 using gill nets, in 1977 using bag seines, in 1982 using trawls in bays, in 1984 using oyster dredges, and in 1985 using trawls in the Gulf to monitor trends and assess the relative abundance and size of shellfish and finfish in Texas marine waters. This sampling program provides a statistically sound and cost-effective method for obtaining information on shellfish and finfish populations. These data are used to determine relative abundance and size in order to formulate management regulations.

The TPWD collects information on all species captured in all gears in the standardized monitoring program. Finfishes caught in bag seines and gill nets are reported in McEachron and Green (1986) and Crowe et al. (In press). To date, finfishes caught in trawls have not been reported. Therefore, to provide fishery managers with additional information on relative abundance and size of finfishes, these data will be presented in this report.

The objectives of this study were to:

1. monitor trends in brown shrimp, white shrimp, pink shrimp, blue crab and Eastern oyster relative abundance and size in Texas bay systems and in the Gulf of Mexico off Texas, and
2. publish the results in a report which will assist resource managers to effectively manage selected shellfishes.

Differences in the statistics in this report compared to previous versions are due to updating the data base and this report should be considered the most accurate to date.

#### MATERIALS AND METHODS

Monofilament gill nets and bag seines were used along shorelines in eight bay systems (Fig. 1-8) during November 1975-June 1985 and during October 1977-March 1986, respectively. Detailed descriptions of the gears, sample stations and sample procedures are reported by McEachron and Green (1986).

Trawls (6.1 m wide at mouth with 3.8-cm stretched mesh throughout, and doors 1.2 m long and 0.6 m tall) were used in seven bay systems during January 1982-March 1986 (Fig. 1-7). Bays were stratified into three zones: Zone 1 (upper bay nearest mouths of rivers), Zone 2 (lower bay farthest from rivers) and Zone 3 [bay to Gulf passes located at: Galveston (Bolivar Roads), Matagorda (Pass Cavallo and Matagorda Ship Channel), Corpus Christi (Lydia Ann Channel), and lower Laguna Madre (Brazos Santiago Pass)]. Trawl sites in each Zone were randomly selected from bay grids (1 minute longitude by 1 minute latitude) that contained water  $\geq 1$  m deep in at least 1/3 of the grid and which were known to be free of obstructions (Appendix A). Five stations were sampled in each of Zone 1 and Zone 2 in each bay system during the 1st-15th and during the 16th-31st of each month except in the upper and lower Laguna Madre systems. In both the upper and lower Laguna Madre systems all water was designated as Zone 2. Two stations were sampled each week in Zone 3. No station was duplicated in a month in Zones 1 and 2; stations were duplicated in Zone 3. Trawls were pulled in a circular motion near the center of each grid in Zones 1 and 2. Trawls were pulled linearly in Zone 3 and direction of tow (Gulfward or bayward) was randomly chosen for the initial tow and alternated on the subsequent tow. All tows were 15.0 minutes long except in upper Laguna Madre (7.5 min). Sampling was discontinued in Zone 3 in August 1985 to improve the operational economic efficiency.

Trawls, identical to those used in the bays, were used in the Texas Territorial Sea ( $<16.7$  km from shore) during February 1985-March 1986 (Fig. 9). Four Gulf areas were selected for sampling: 24.1 km either

side of each of the Galveston jetties (Galveston), Matagorda jetties (Port O'Connor), and Aransas Pass jetties (Port Aransas), and 48.2 km north from the Texas-Mexico border (Port Isabel). The area off Port Aransas was sampled beginning in February 1985; all other areas were sampled beginning in August. Trawl sites in each area were randomly selected from Gulf grids that contained water  $>1.8$  m deep in at least 1/3 of the grid and which also were in the Texas Territorial Sea and free from known obstructions (Appendix B). Eight stations were sampled in each area during the 1st-15th and during the 16th-31st of each month. No station was duplicated in a month. Trawls were pulled linearly and direction of tow (north or south) was randomly chosen for the initial tow and alternated on subsequent tows. All tows were 15.0 minutes long.

Trawls (12.2 m wide at mouth) were used at night in the Gulf off Galveston, Port O'Connor, Port Aransas and Port Mansfield-Port Isabel during 1 June-6 July 1985 in conjunction with the Southeastern Monitoring and Assessment Program (SEAMAP). Detailed descriptions of the gear, sample stations and sample procedures are reported by Stuntz et al. (1984).

Oyster dredges [8-tooth Louisiana style: 46 cm wide, 25 cm tall with a 36 cm deep bag (6 bottom rows of linked metal rings 5 cm in diameter; four top rows of 7.6-cm mesh webbing made of 0.8-cm nylon rope)] were used in Galveston Bay during October 1984-December 1985 (Fig. 1). The bay was stratified into "reef" (mapped area in which Eastern oysters form reefs and are  $>0.2$  m higher than adjacent bottom for a continuous distance of  $>91.4$  m long and 0.4 m wide) and "non-reef" (remaining bay bottom  $>1$  m deep) areas. Oyster dredge sites in each "reef" and "non-reef" area were randomly selected from bay grids (Appendix C). Each selected grid was divided into 144-5 sec "gridlets". All "gridlets" that contained the respective "reef" or "non-reef" area were used to randomly choose sample sites. Fifty stations (40 "reef"; 10 "non-reef") were sampled during the 1st-15th and during the 16th-31st of each month. No station was duplicated in a month. Dredges were pulled linearly for 30 seconds.

Historical oyster reef sites (TPWD unpublished data) were sampled with an oyster dredge during September and October 1985 prior to the opening of the oyster season to determine availability of oysters. Ten sites were sampled in Galveston Bay (Redfish reef), three sites in East Matagorda Bay (Dressing Point Reef, Chinquapin Reef, and Raymond Shoal Reef), four sites in each of Matagorda (Gallinipper Reef, Cox Bay, Keller Bay, Carancuhua Bay) and San Antonio (Chickenfoot Reef, Panther Point Reef, Middleground Reef, South Pass Reef) Bays and five sites in Aransas Bay (Long Reef, Halfmoon Reef, Thompson Reef, Lap Reef, Copano Reef).

Each sampling week for trawls and oyster dredges extended from sunrise Monday through sunset the following Sunday. Collections were made during daylight hours only.

Blue crab gill net catch rates were calculated by dividing the total number caught by the total hours fished from all samples in a season. Trawl and bag seine catch rates of blue crab, brown shrimp, pink shrimp, and white shrimp were calculated by dividing the total number of each species by the total hours fished (trawl) or hectares sampled (bag seine) from all samples in a month. Catch rates of associated finfishes caught in trawls were calculated identically to those for shellfish. Eastern oysters were grouped into spat (5-25 mm), small oysters (26-75 mm) and market oysters (> 76 mm); catch rates were calculated by dividing the total number captured by the total hours fished from all samples in a month. Coastwide catch rates were weighted by the length of each bay system's shoreline (gill net, bag seine), by the amount of surface area >1 m deep (Matlock and Ferguson 1982) in each bay system (bay trawl) or by the total number of trawlable grids (Gulf trawl). Both annual bag seine and trawl catch rates were calculated from monthly means (unweighted by sample size).

Total length (carapace width measured from spine to spine) of blue crab caught in gill nets were obtained for the first 19 individuals caught in each mesh size each week in each bay system; mean lengths were calculated for each of the four mesh sizes in each sample. Mean lengths for the combined gill net meshes were calculated by weighting the mean lengths in each mesh by the proportion of blue crabs caught in each mesh. Total lengths (shrimp: tip of rostrum to tip of telson) for brown shrimp, pink shrimp, white shrimp and blue crab caught in bag seines were obtained from a random selection of no more than 19 individuals of each species in each sample. Total lengths of selected shrimps and blue crab caught in trawls were obtained from a random selection of no more than 50 shrimp of each species and 35 blue crabs in each sample. Total lengths of associated finfishes caught in trawls were obtained from a random selection of no more than 19 individuals of each species in each sample. Total lengths (hinge to bill) of Eastern oysters caught in oyster dredges were obtained from a random selection of no more than 19 live oysters in each sample. Coastwide lengths (nearest 1 mm) of all organisms were weighted according to the catch rate in each bay system.

Bottom salinity, water temperature, dissolved oxygen and turbidity were measured prior to each trawl and oyster dredge sample; means were calculated for each month. Surface salinity, water temperature, dissolved oxygen and turbidity were measured at the set and pickup for each gill net and prior to each bag seine sample. Hydrologic parameter means for gill nets (season) and bag seines (month) are reported by Crowe et al. (In press).

## RESULTS

### Gill Net

Spring and fall coastwide blue crab catch rates were  $\leq 0.2/h$  in all years (Tables 1 and 2). Catch rates among bay systems ranged from  $< .1/h$  in both upper Laguna Madre during spring 1983 and Matagorda Bay during fall 1985 to  $0.5/h$  in East Matagorda Bay during spring 1985.

### Bag Seine

Coastwide annual blue crab bag seine catch rates fluctuated from  $49/ha$  in 1978 to  $114/ha$  in 1985 (Table 3). Catch rates among bay systems ranged from  $9/ha$  in lower Laguna Madre during 1977 to  $193/ha$  in Aransas Bay during 1982.

Coastwide annual brown shrimp catch rates increased from  $136/ha$  in 1977 to  $511/ha$  in 1982, decreased to  $336/ha$  in 1983 then increased to  $528/ha$  in 1985 (Table 3). Catch rates among bay systems ranged from  $9/ha$  in upper Laguna Madre during 1977 to  $1024/ha$  in lower Laguna Madre during 1985.

The highest coastwide annual pink shrimp catch rates occurred during 1981 ( $24/ha$ ) and 1982 ( $26/ha$ ); they ranged from  $3-12/ha$  in all other years (Table 3). Highest catch rates generally occurred in Aransas Bay ( $0-124/ha$ ), Corpus Christi Bay ( $0-67/ha$ ) and upper Laguna Madre ( $7-48/ha$ ). Catch rates in all other bay systems were  $\leq 13/ha$  except for San Antonio Bay during 1981 ( $28/ha$ ).

The highest coastwide annual white shrimp catch rate occurred during 1982 ( $1277/ha$ ); they fluctuated from  $226-758/ha$  in all other years (Table 3). Catch rates among bay systems ranged from  $3/ha$  in upper Laguna Madre during 1983 to  $3560/ha$  in Galveston Bay during 1982.

Coastwide monthly bag seine catch rates during January 1985-March 1986 indicated seasonal peaks in abundance varied among species (Appendix D). Blue crab coastwide catch rates were highest during March-June 1985 and March 1986. Coastwide brown shrimp catch rates were highest during April-June 1985. Highest coastwide pink shrimp catch rates occurred during March and October 1985 and March 1986; none were caught in Galveston, Matagorda and San Antonio Bays. Coastwide white shrimp catch rates were highest during June-November 1985.

### Bay Trawl

#### Zones 1 and 2 combined

Coastwide annual blue crab bay trawl catch rates ranged from  $15/h$  in 1984 to  $21/h$  in 1985 (Table 4). Catch rates among bay systems ranged from  $2/h$  in Corpus Christi Bay during 1983 to  $50/h$  in lower Laguna Madre during 1984.

Coastwide annual brown shrimp catch rates were lower in 1982 (27/h) and 1983 (20/h) than in 1984 and 1985 (30/h each year) (Table 4). Catch rates among bay systems ranged from 6/h in lower Laguna Madre during both 1982 and 1984 to 106/h in Aransas Bay during 1984.

Coastwide annual pink shrimp catch rates were < 2/h in all years (Table 4). Catch rates among bay systems ranged from 0/h in both Galveston Bay during 1984 and lower Laguna Madre during 1982 to 9/h in Aransas Bay during 1983.

Coastwide annual white shrimp catch rates decreased from 47/h in 1982 to 32/h and 33/h in 1984 and 1985, respectively (Table 4). Catch rates among bay systems ranged from 1/h in lower Laguna Madre during 1985 to 87/h in Galveston Bay during 1982.

Coastwide monthly bay trawl shellfish catch rates during January 1985-March 1986 indicated seasonal peaks in abundance varied among species (Appendix D). Blue crab coastwide catch rates were highest during March-June 1985. Coastwide brown shrimp catch rates were highest during May-June 1985. The highest catch rate of pink shrimp occurred during April 1985. Coastwide white shrimp catch rates were highest during January and August-December 1985.

Individual finfish coastwide and monthly catch rates and mean lengths varied among species, among bays, among years and among months (Table 4; Appendix D).

Hydrologic parameters varied among months and among bay systems (Appendix E). Coastwide salinities ranged from 16.2 o/oo in April to 27.3 o/oo in September. Individual bay system salinities were generally higher (29.5-42.0 o/oo) in upper and lower Laguna Madre than in any other bay system (7.9-34.1 o/oo). Water temperatures followed seasonal trends increasing from the lowest values during January (9.7-12.0 C) to highest values during August (29.4-31.4 C) then declining through December (11.7-16.5 C). Dissolved oxygen ranged from 7-11 ppm coastwide and ranged from 6-14 ppm among bay systems. Turbidities were < 56 Jackson Turbidity Units (JTU) coastwide; they ranged from 25-183 JTU's among bay systems.

### Zone 3

Monthly catch rates indicate seasonal peaks in abundance varied among species and among passes (Appendix D). Highest blue crab catch rates occurred in the Galveston Bay pass during February (234/h); peaks of abundance occurred during April in both the Matagorda Bay (13/h) and lower Laguna Madre (24/h) passes and during July in both the Aransas Bay (78/h) and Corpus Christi (29/h) Bay passes. Monthly brown shrimp catch rates were generally highest during May-June (< 1-421/h) in all

passes. Pink shrimp catch rates were  $\leq$  6/h in all passes and months except during April in the Aransas Bay pass (51/h). White shrimp catch rates were generally higher in the Galveston Bay pass (2-212/h) than the other passes (0-38/h) during each respective month.

Individual finfish monthly catch rates varied among species, among passes and among months (Appendix D).

Hydrologic parameters varied among months and among passes (Appendix E). Coastwide salinities ranged from 21.9 o/oo in March to 30.7 o/oo in June. Salinities generally increased during March-July in all passes. Water temperatures followed seasonal trends increasing from a coastwide low of 11.6 C in January to a high of 28.6 C in July. Dissolved oxygen ranged from 7-9 ppm coastwide and from 6-12 ppm among passes. Turbidities were  $\leq$  50 JTU's coastwide; they ranged from 25-118 JTU's among passes.

#### Gulf Trawls

Coastwide and individual area annual blue crab Gulf trawl catch rates were  $\leq$  1/h during 1985 in all areas (Table 5). Coastwide monthly catch rates were highest (4/h) during June (Appendix D).

Coastwide annual brown shrimp catch rates were 19/h in 1985; they ranged from 7/h off both Galveston and Port O'Connor to 45/h off Port Aransas (Table 5). Coastwide monthly catch rates were highest (437/h) during June (Appendix D).

Coastwide and individual area annual pink shrimp catch rates were  $\leq$  1/h in 1985 (Table 7). Coastwide monthly catch rates were highest (3-4/h) during February and November 1985 and March 1986 (Appendix D).

Coastwide annual white shrimp catch rates were 24/h in 1985; they ranged from 1/h off Port Isabel to 53/h off Galveston (Table 5). Coastwide monthly catch rates were highest (67/h) during December 1985 and January 1986 (Appendix D).

Individual finfish coastwide and monthly catch rates and mean lengths varied among species, among Gulf areas and among months (Appendix D).

Hydrologic parameters varied among months and among Gulf areas (Appendix E). Coastwide salinities ranged from 26.9 o/oo in March to 35.6 o/oo in August. Water temperatures followed seasonal trends increasing from lowest values in February (13.6 C) to highest values in September (28.8 C). Dissolved oxygen ranged from 7-10 ppm coastwide with a range of 6-14 ppm among Gulf areas. Turbidities were  $\leq$  41 JTU's; they ranged from 24-58 JTU's among Gulf areas.

## SEAMAP

Catch rates of brown shrimp by depth zone ranged from 1362/h in 19-37 m to 36/h in 74-91 m during 1985 (Appendix F). Catch rates in most depth zones during 1985 were generally less than those recorded during 1982-1984.

White shrimp were caught primarily in waters from 0-18 m deep during all years (Appendix F). Catch rates increased each year from 15/h in 1982 to 41/h in 1985 in the 0-18 m depth zone.

Pink shrimp were captured in waters from 0-55 m deep (0-195/h) during all years (Appendix F). They were caught predominately in waters 0-37 m deep.

Blue crabs were caught primarily in the 0-18 m zone (Appendix F). Catch rates ranged from 0-20/h in all years.

## Oyster Dredge

## Random samples

Overall monthly catch rates of Eastern oyster in "reef" areas in Galveston Bay ranged from 3588/h during April 1985 to 9984/h during September 1985 (Table 6). Catch rates of spat ranged from 24/h in May 1985 to 5640/h during July 1985. Catch rates of small oysters ranged from 2520/h during December 1984 to 6684/h during September 1985. Highest catch rates of market oysters occurred during September-December 1985 (1446-1932/h); they ranged from 660-1248/h in all other months.

Combined monthly catch rates of Eastern oyster in "non-reef" areas ranged from 0/h in both December 1984 and August 1985 to 756/h in October 1985 (Table 7). Catch rates of spat ranged from 0-84/h in all months. The highest catch of small oysters occurred during October 1985 (600/h); all other catch rates were < 180/h. The highest catches of market oysters occurred during March (120/h) and October (96/h) 1985; all other catch rates were  $\leq$  48/h.

Salinities varied among months ranging from 8.4 o/oo during March to 24.0 o/oo during both August and September (Appendix E). Water temperatures followed seasonal trends increasing from lowest values in January (9.3 C) to highest values in August (30.6 C) then decreasing through December (14.0 C).

## Historical samples

Catch rates of Eastern oysters at historical reef stations ranged from 108/h in East Matagorda Bay during 1984 to 18,444/h in Matagorda

Bay during 1984 (Appendix G). The overall Eastern oyster catch rate decreased in Matagorda (18,444/h to 5202/h), San Antonio (9046/h to 3072/h) and Aransas (10,133/h to 8059/h) Bays but increased in Galveston (2988/h to 6694/h) and East Matagorda (108/h to 3592/h) Bays from 1984 to 1985. Highest catches of spat (4918/h), small oysters (12,758/h) and market oysters (768/h) occurred in Matagorda Bay during 1984.

#### DISCUSSION

The TPWD is mandated by the Texas Legislature and the TPW Commission to investigate the supply, economic value, environment, breeding habits, sex ratios, effects of fishing and other factors or conditions causing increases or decreases in the supply of shellfish and finfish in Texas waters. Long-term trend data based on independent standardized monitoring programs are necessary to assess changes in relative abundance of these populations. Data in this report can be used to determine long-term trends in abundance and stability of shellfish and finfish populations in Texas coastal waters. It is, therefore, imperative that the standardized monitoring program used by the TPWD be maintained.

Data obtained during this study were used to implement management regulations. Shrimp data were used to recommend the 1983, 1984 and 1985 dates for the closure of Texas Gulf waters to shrimping (Bryan 1985, 1986, In preparation). Oyster data were used to implement a shorter oyster season in Galveston Bay (1 November 1983-31 March 1984) and to delay the opening of the oyster season from 1 November 1984 to 15 January 1985 (TPWD unpublished data). Additionally, oyster data were used to establish the oyster transplant season in Galveston Bay (TPWD unpublished data). These data are being used to develop management plans for shrimp and oysters as mandated by the Texas Legislature, and for blue crabs and selected finfishes as part of the TPWD's 6-year plan.

Relative abundance of shellfishes is not uniform throughout the year. The monthly bag seine, trawl and oyster dredge catches in this report indicate specific periods of high abundance for brown shrimp, white shrimp, pink shrimp, blue crab and Eastern oyster. A more efficient method of estimating abundance from year to year (estimate having the highest precision for effort expended) would be to identify and pool data for months which do not have significantly different catch rates. It is recommended that periods of high abundance in bag seines, trawls and oyster dredges be statistically determined for each of the species for the appropriate gear and that these "seasonal" catch rates be presented in future reports.

Appendix D. Mean catch rates of selected shellfishes and finfishes  
in bag seines (No./ha), bay trawls (No./h) and Gulf trawls  
(No./h) by month and bay system.

Table D.1. Monthly mean catch rates (No./ha) and mean total lengths (mm) of select shellfishes caught with 18.3-m bag seines by bay systems during January 1985–March 1986. Blank indicates no measurement taken.

	38-55	14	150	127	0		<1	127	0	
	56-73	5	154	144	0		0	0	0	
	74-91	1	36	179	0		0	0	0	

<sup>a</sup> Data presented here were collected by R/V OREGON II (NMFS), R/V WESTERN GULF (TPWD) and R/V Aransas Bay. The data were made available by the Southeast Area Monitoring and Assessment Program (SEAMAP). Samples collected with 12.2-m trawl.

Appendix G. Mean catch rates (No./h) of Eastern oyster (Crassostrea virginica) caught with oyster dredges at selected stations by bay system and year.

Table G.1. Mean catch rate (No./h) by size class (mm)<sup>a</sup> of Eastern oyster (*Crassostrea virginica*) caught with 46.0-cm wide dredges at selected historical stations in Texas bays during September-October 1984 and 1985.

Bay	Year	No./h			
		Spat	Small	Market	Total
Galveston	1984	462	1912	614	2988
	1985	1130	4954	610	6694
East Matagorda	1984	37	50	20	108
	1985	1624	1536	432	3592
Matagorda	1984	4918	12,758	768	18,444
	1985	3222	1614	366	5202
San Antonio	1984	1302	7396	348	9046
	1985	54	2232	300	3072
Aransas	1984	b	9554 <sup>b</sup>	578	10,133
	1985	1877	5928	254	8059

<sup>a</sup>Spat (5-25mm), small (26-75mm), market (> 76mm).

<sup>b</sup>Spat and small combined.
