ACKNOWLEDGEMENTS

I would like to express my appreciation to each member of the Bay Finfish Monitoring Program who so conscientiously collected all scheduled samples. Thanks also go to all Coastal Fisheries staff who have aided in many ways toward the successful completion of this program. This study was conducted with partial funding from the U. S. Department of Interior; Fish and Wildlife Service under DJ 15.605 (Project F-32-R-3).

MONITORING OF COASTAL FINFISH RESOURCES
FOR SPORT FISH MANAGEMENT
OCTOBER 1980-SEPTEMBER 1981

ABSTRACT

Seasonal (November-March) catch rates of red drum (Sciaenops ocellatus) in gill nets declined ~50% from 1975-76 through 1977-78 and increased ~50% from 1977-78 through 1979-80 within each bay system except East Matagorda Bay and the lower Laguna Madre. The 1980-81 seasonal catch rates declined to approximately the 1977-78 levels in Galveston, Matagorda and San Antonio Bays; remained at 1979-80 levels in Aransas and Corpus Christi Bays; and declined slightly from the 1979-80 levels in the upper Laguna Madre. Catches of red drum in East Matagorda Bay have remained at about 0.3 fish/h during 1976-1980, the 1980-81 seasonal catch rate increased to 0.7 fish/h. In the lower Laguna Madre seasonal catches of red drum declined ~50% from about 1.0 fish/h during 1975-77 to about 0.5 fish/h during 1978-1981. The highest seasonal mean catch rate (1.4 fish/h) of red drum occurred in 1979-80 in Matagorda Bay; the lowest catch rate (0.1 fish/h) occurred in 1977-78 in the upper Laguna Madre. Seasonal mean lengths ranged from 371 to 522 mm.

Seasonal catch rates of spotted seatrout (Cynoscion nebulosus) declined at least 50% within each bay system from 1975-76 through 1980-81. The highest seasonal mean catch rate of spotted seatrout (1.6 fish/h) occurred in 1975-76 in the lower Laguna Madre; the lowest catch rate (0.1 fish/h) occurred at least once in each bay system except Matagorda and Aransas Bays and the lower Laguna Madre. Mean total lengths ranged from 387 to 552 mm.

Seasonal catch rates of black drum (Pogonias cromis) in Galveston Bay, Aransas Bay and the lower Laguna Madre have declined ~50% from 1975-76 through 1979-80 followed by increases in 1980-81. In East Matagorda Bay, San Antonio Bay, Corpus Christi Bay and the upper Laguna Madre the seasonal catch rates of black drum have remained low and within narrow ranges. In Matagorda Bay catch rates have declined >50% from 1975-76 (1.3 fish/h) to 1980-81 (0.4 fish/h) except during 1978-79 (1.1 fish/h). The highest seasonal mean catch rate of black drum (2.3 fish/h) occurred in 1975-76 in the lower Laguna Madre; the lowest catch rates (0.1 fish/h) occurred in 1977-78 and 1978-79 in Corpus Christi Bay. Larger black drum (383-455 mm total length) occurred in the upper and lower Laguna Madre than in the other bay systems (304-412 mm).

Seasonal catch rates of sheepshead (Archosargus probatocephalus) with gill nets were either too low or erratic to detect annual patterns or trends. Seasonal catch rates of sheepshead generally remained < 0.3 fish/h in all bay systems during 1975-81; the highest catch rate (1.0 fish/h) of

sheepshead occurred in the lower Laguna Madre during 1975-76. Seasonal mean lengths ranged from 253 to 408 mm.

Season catch rates of southern flounder (Paralichthys lethostigma) remained at < 0.1 fish/h in all bay systems from 1975-76 through 1980-81. Seasonal mean total lengths of southern flounder ranged from 279 to 468 mm. The seasonal catch rates of Atlantic croaker (Micropogonias undulatus) remained at < 0.1 fish/h in all bay systems from 1975-76 through 1980-81, except in 1975-76 in the lower Laguna Madre when the catch rate was 0.2 fish/h. Seasonal mean total lengths ranged from 238 to 363 mm.

The individual meshes of the gill net were selective for species and size. In each bay system, the 7.6- and 10.2-cm stretched meshes caught primarily red drum and spotted seatrout. Black drum and southern flounder were caught primarily in the 10.2- and 12.7-cm meshes; sheepshead were caught primarily in the 12.7- and 15.2-cm meshes. Atlantic croaker were restricted almost exclusively to the 7.6-cm mesh.

Red drum catch rates with trammel nets were generally higher in each fall (October-November) than those in the following spring (April-May) in each bay system. The highest trammel net catch rate of red drum (7.24 fish/ha) occurred in the spring 1980 in Matagorda Bay. Seasonal mean total lengths for red drum were larger in the spring (361-502 mm) than in the fall (346-459 mm).

Seasonal trammel net catch rates of spotted seatrout were generally highest during the fall in Galveston, Matagorda and San Antonio Bay and generally highest during the spring in Aransas Bay and the upper and lower Laguna Madre. The highest seasonal catch (7.35 fish/ha) of spotted seatrout occurred in spring 1981 in the lower Laguna Madre. Seasonal mean total lengths ranged from 398 to 578 mm.

Fall trammel net catch rates of black drum were generally higher than spring catch rates in all bay systems except in Aransas and Corpus Christi Bays. The highest seasonal catch rate (9.46 fish/ha) occurred in fall 1978 in Matagorda Bay. Seasonal mean total lengths ranged from 226 to 388 mm.

Spring 1981 trammel catch rates of sheepshead in each bay system except the upper and lower Laguna Madre exceeded the catch rates of the previous years within the same season. The highest seasonal catch rate (9.67 fish/h) occurred in spring 1981 in Matagorda Bay. Seasonal mean total lengths ranged from 238 to 422 mm.

The seasonal mean trammel net catch rates of southern flounder varied among seasons and among bay systems. The highest seasonal catch rate (1.40 fish/ha) occurred in spring 1980 in Corpus Christi Bay. Seasonal mean total lengths ranged from 202 to 399 mm.

Seasonal mean trammel net catch rates of Atlantic croaker in Matagorda, San Antonio and Aransas Bays were substantially lower than those in the other

bay systems. The highest seasonal catch rate of Atlantic croaker (11.36 fish/ha) occurred in spring 1978 in the lower Laguna Madre. The seasonal mean total length ranged from 244 to 310 mm.

Annual catch rates (1977-81) with bag seines indicated considerable variation in relative abundance among bay systems of juvenile red drum (0.35-70.09 fish/ha), spotted seatrout (0.34-39.41 fish/ha), black drum (0.00-37.04 fish/ha), sheepshead (0.00-15.74 fish/ha), southern flounder (0.00-10.98 fish/ha) and Atlantic croaker (0.35-1086.92 fish/ha).

Monthly catch rate patterns revealed specific seasons during which red drum (October-April), spotted seatrout (July-November), black drum (May-September), sheepshead (May-August), southern flounder (February-May) and Atlantic croaker (January-June) were most available. During the season of highest availability, the mean total lengths of red drum, black drum and Atlantic croaker generally increased monthly.

INTRODUCTION

Finfish in Texas bays support both commercial and recreational industries. Commercial fishermen in the Texas bay systems (Galveston, East Matagorda, Matagorda, San Antonio, Aransas, Corpus Christi Bays and Laguna Madre) reported landing 1,781,393 kg of fish during January-December 1980 (Hamilton 1981). From September 1979 through August 1980 recreational boat, wade/bank and lighted pier fishermen harvested an estimated 1,851,700 kg of fish from these same bay systems (McEachron et al. 1981). Six species--spotted seatrout (Cynoscion nebulosus), red drum (Sciaenops ocellatus), black drum (Pogonias cromis), sheepshead (Archosargus probatocephalus), southern flounder (Paralichthys lethostigma) and Atlantic croaker (Micropogonias undulatus)--accounted for 94.4% of the total weight reported by commercial fishermen and 87.2% of the estimated total weight caught by recreational fishermen.

Estimates of the harvest and availability of the finfish resource are necessary in order to evaluate and implement management decisions effectively. Commercial harvest statistics have been collected by the Texas Parks and Wildlife Department (TPWD) since 1936 (Heffernan and Kemp 1980). Collection of coastwide marine recreational harvest and pressure statistics were initiated by the TPWD in 1974 (Heffernan et al. 1976).

Fish availability and gear selectivity studies have been conducted periodically along the Texas coast since the late 1800's (Stevenson 1893). Information has been gathered on species diversities, relative abundances and life histories of the commercially and recreationally important fishes.

In November 1975 the Coastal Fisheries Branch of TPWD initiated a standardized program for gathering comparable information on the availability of finfish in Texas bay systems. In addition to gathering baseline data, various gear types and techniques were evaluated from November 1975 to September 1977. In October 1977 an 8-mo study was funded by NOAA, NMFS under PL 88-309 (Project No. 2-313-R) to continue monitoring finfish resources with gill nets, trammel nets and bag seines for developing long-term fish availability trends.

In October 1978 the U. S. Department of Interior, Fish and Wildlife Service approved a 5-yr program to continue monitoring trends in relative abundance and size of economically important saltwater fishes. Gill nets, trammel nets and bag seines were employed. Annual, seasonal and monthly catch rate and mean total length data for each gear type were summarized with previous years' data. This report is the summarization of the data collected during the third year, October 1980-September 1981. Any difference in this report compared to previous reports is due to updating of the data base and the most recent report should be considered the most accurate.

AREA DESCRIPTION

The Texas Gulf coastline, extending from Sabine Pass to the mouth of the Rio Grande is approximately 595 km long (Diener 1975). Situated behind the barrier islands and peninsulas is a series of enclosed or semienclosed estuarine complexes (Figure 1).

Excluding Sabine Lake, the estuarine complexes of the Texas coast can be separated into eight physically and biologically distinct bay systems. These include Galveston, East Matagorda, Matagorda, San Antonio, Aransas and Corpus Christi Bay systems; the Laguna Madre can be considered as two distinct systems (upper and lower areas) due to the geographical barrier created by the "land cut" located approximately in the middle of the Laguna Madre.

Diener (1975) gave a comprehensive description of physical and biological characteristics of the Texas coastal zone. Photocopies of the area descriptions from Matlock and Weaver (1979) are presented in Appendix A.

MATERIALS AND METHODS

Gill Nets

Gill nets were 183 m long and 1.2 m deep with separate 46-m sections of 7.6-, 10.2-, 12.7- and 15.2-cm stretched monofilament meshes. Thread sizes were #12 (Nylon Net Company) for the 7.6- and 10.2-cm meshes, #6 for the 12.7-cm mesh and #7 for the 15.2-cm mesh. Webbing in each section was hung to both the float and lead lines on a one-half basis. One-half basis indicates that a hung or finished gill net is one half the length of the amount (length) of a stretched webbing before hanging. All four sections were tied together; 7.6-cm tied to 10.2-cm, 10.2-cm tied to 12.7-cm and 12.7-cm tied to 15.2-cm.

From October 1980 through May 1981 samples were collected with monofilament gill nets in the Galveston Bay, East Matagorda Bay, Matagorda Bay, San Antonio Bay, Aransas Bay, Corpus Christi Bay, upper Laguna Madre and lower Laguna Madre systems (Figures 2-10). One overnight set was made at four different stations each month in each bay system. Stations were randomly selected from a list of <100 sample stations compiled for each bay system (Appendix B). Each station on the list was at least 1.6 km of continuous shoreline from any other gill net stations.

Two gill net sets were completed during the first two fullest weeks of each month and two additional sets were made during the last two fullest weeks of each month. Each sampling week extended from 1 h before sunset on Sunday through 1 h after sunrise the following Sunday.

Each gill net was set extending from the surface to the bottom and perpendicular to shore with the end with the smallest mesh on shore. Gill nets were set within 1 h before sunset and were raised within 1 h after the following sunrise. The total fishing time (to the nearest 0.1 h) was recorded.

Each fish landed was identified to species (Gallaway et al. 1972, Hoese and Moore 1977) and counted. The mesh size capturing each fish was noted. Total lengths (to the nearest mm) and wet weights (to the nearest 5 g) were obtained for the first 20 individuals of each species from each mesh size during each month.

Catch rates and fish sizes were determined on a monthly basis for red drum, black drum, spotted seatrout, sheepshead, southern flounder and Atlantic croaker caught in each mesh size and in the total net.

Monthly catch rates (no/h) for each species were calculated using the ratio estimator:

$$\frac{N}{H} \quad N = \text{total number of fish caught}$$

$$H = \text{total hours fished}$$

Values were reported to the nearest 0.1 fish/h; the notation <.1 fish/h was used to indicate that at least one fish was caught but due to the rounding, the value of the derived catch rate was less than the established degree of precision (Cochran 1977). Monthly catch rates (kg/h) for each species were calculated using the ratio estimator:

$$\frac{\sum_{i=1}^n w_i \cdot N}{n}$$

$$\frac{H}{\sum_{i=1}^n w_i}$$

w_i = individual fish weights
 n = number of fish weighed
 N = total number of fish caught
 H = total hours fished

Values were reported to the nearest 0.1 kg/h; the notation <.1 kg/h was used to indicate that at least one fish was weighed but due to rounding, the value of the derived catch rate was less than the established degree of precision. Size (total length to the nearest 1 mm) of each species for each month was calculated using the ratio estimator:

$$\frac{\sum_{i=1}^n l_i}{n}$$

l_i = individual fish lengths
 n = number of fish measured

Trammel Nets

Trammel nets were 366 m long and 1.2 m deep with 30.5-cm stretched nylon multifilament (#15) mesh outer walls and 7.6-cm stretched nylon multifilament (#415) mesh inner walls. Webbing was colored with a combination of green and brown dyes.

During October-December 1980 and March-May 1981 samples were collected with multifilament trammel nets in the Galveston Bay, Matagorda Bay, San Antonio Bay, Aransas Bay, Corpus Christi Bay, upper Laguna Madre and lower Laguna Madre systems (Figures 11-18). Twelve different sets were made each month in each bay system. Stations were randomly selected from a list of <100 sample stations compiled for each bay system (Appendix C). Each station on the list was at least 1.6 km of continuous shoreline from any other trammel net station.

Six trammel net sets were completed during the first two fullest weeks of each month and six additional sets were made during the last two fullest weeks of each month. Each sampling week extended from sunrise Monday through sunset the following Sunday. Trammel nets were utilized only during daylight hours.

Each trammel net was set to form a 1.67-ha rectangular area (91 m by 183 m) with the shoreline as one long side. The enclosed area was "struck" utilizing an outboard motor or walking techniques in order to create a disturbance thus scaring the enclosed fish into the net.

Each fish landed was identified to species (Gallaway et al. 1972, Hoese and Moore 1977) and counted. Total lengths (to the nearest mm) and wet weights (to the nearest 5 g) were obtained for the first 20 individuals of each species caught in each set during each month.

Abundances and fish sizes were determined on a monthly basis for red drum, black drum, spotted seatrout, sheepshead, southern flounder and Atlantic croaker. Monthly abundances (no/ha and kg/ha) for each species were calculated identical to catch rates for gill nets, except total area fished (ha to the nearest 0.01) was used instead of total hours fished. Size of each species was also calculated identical to mean lengths for gill nets.

Bag Seines

Each bag seine was 18.3 m long and 1.8 m deep with 1.9-cm stretched nylon multifilament mesh in the lateral wings and 1.3-cm stretched nylon multifilament mesh in the central bag.

From October 1980 through September 1981 samples were taken with bag seines in the Galveston Bay, Matagorda Bay, San Antonio Bay, Aransas Bay, Corpus Christi Bay, upper Laguna Madre and lower Laguna Madre systems (Figures 19-26). Six different shoreline stations were sampled each month in each bay system. Stations were randomly selected from a list of <100 sample stations compiled for each bay system (Appendix D). Each station on the list was at least 1.6 km of continuous shoreline from any other bag seine station.

Three different stations were sampled with bag seines during each of the first two and last two fullest weeks of each month. Each sampling week extended from sunrise Monday through sunset of the following Sunday. Stations were sampled only during daylight hours.

A bag seine sample was collected by pulling an extended seine parallel to shore for a distance of no less than 15.2 m and no more than 30.5 m. The rectangular surface area sampled was estimated using the distance pulled and the length of extension of the bag seine.

From each bag seine sample collected all fish were identified to species (Hoese and Moore 1977; Walls 1975; Gutherz 1967; Hildebrand and Cable 1930, 1940; Pearson 1928) and counted. In addition, a random sample of no more than 20 individuals of each species were measured (total length). Abundance estimates (no/ha) and sizes were calculated in the same manner used for trammel net data.

General Procedures

The randomly selected stations for each gear type could not always be sampled as scheduled. If a preselected station could not be sampled, an alternate randomly selected station or an alternate day was substituted.

Fish data from each gear type were recorded on standard data forms. These data were key punched, placed on magnetic tape and summarized by computer at the Data Processing Section, TPWD, Austin.

Several hydrological parameters were measured at the time of the set and retrieval of each gill net sample and at the set of each trammel net and bag seine sample. Monthly means of salinity, water temperature, turbidity and dissolved oxygen are summarized in Appendix E.

RESULTS

Gill Nets

During each month from October 1980 to May 1981, 4 overnight net sets were completed in each bay system. The seasonal mean catch rates (no/h)

and mean total lengths (mm) for all meshes combined for the period November-March, 1975-1981 are summarized in Table 1. The monthly mean catch rates and mean total lengths by mesh size for October 1980-May 1981 are summarized in Tables 2-49.

Red Drum

The seasonal (November-March) catch rates of red drum declined ~50% from 1975-76 through 1977-78 and increased ~50% from 1977-78 through 1979-80 within each bay system except East Matagorda Bay and the lower Laguna Madre (Table 1). The 1980-81 seasonal catch rates declined to approximately the 1977-78 levels in Galveston, Matagorda and San Antonio Bays; remained at 1979-80 levels in Aransas and Corpus Christi Bays; and declined slightly from the 1979-80 levels in the upper Laguna Madre. Catch rates in East Matagorda Bay have remained at about 0.3 fish/h during 1976-1980; the 1980-81 seasonal catch rate increased to 0.7 fish/h. In the lower Laguna Madre seasonal catches of red drum declined ~50% from about 1.0 fish/h during 1975-1977 to about 0.5 fish/h during 1978-1981. The highest seasonal mean catch rate of red drum (1.4 fish/h) occurred in 1979-80 in Matagorda Bay; the lowest catch rate (0.1 fish/h) occurred in 1977-78 in the upper Laguna Madre. Seasonal mean total lengths ranged from 371 to 522 mm.

In all bay systems, the highest monthly mean catch rate of red drum occurred in the 7.6- and 10.2-cm meshes (Tables 2-9). For all meshes combined, the lowest catch rates (<0.1 fish/h) occurred in Galveston Bay in January and February and in East Matagorda Bay in February and March. The highest catch rate (1.8 fish/h) occurred in Aransas Bay in November. Mean total lengths ranged from 342 mm in December in Matagorda Bay to 580 mm in March in East Matagorda Bay.

Spotted Seatrout

The seasonal (November-March) catch rates of spotted seatrout declined at least 50% within each bay system from 1975-76 through 1980-81 (Table 1). In Matagorda Bay the catch rates declined from 1975-76 (0.5 fish/h) to 1977-78 (0.3 fish/h) and increased to 0.6 fish/h in 1978-79 followed by another decline in 1980-81 to 0.2 fish/h. The highest seasonal mean catch rate of spotted seatrout (1.6 fish/h) occurred in 1975-76 in the lower Laguna Madre; the lowest catch rate (0.1 fish/h) occurred at least once in each bay system except Matagorda and Aransas Bays and the lower Laguna Madre. Mean total lengths ranged from 387 to 552 mm.

The highest monthly mean catches of spotted seatrout occurred in the 7.6- and 10.2-cm meshes in all bay systems (Table 10-17). No spotted seatrout were caught in the 12.7- or 15.2-cm meshes in Matagorda Bay. For all meshes combined, the lowest monthly mean catch rate (<0.1 fish/h) occurred at least once in each bay system except the upper and lower Laguna Madre; the highest catch rate (2.8 fish/h) occurred in April in the lower Laguna Madre. Mean total lengths ranged from 375 mm in April in Matagorda Bay to 645 mm in January in the upper Laguna Madre.

Black Drum

The seasonal catch rates of black drum in Galveston Bay, Aransas Bay and the lower Laguna Madre have declined $\geq 50\%$ from 1975-76 through 1979-80 followed by increases in 1980-81. In East Matagorda Bay, San Antonio Bay, Corpus Christi Bay and the upper Laguna Madre the seasonal catch rates of black drum have remained low and within narrow ranges (0.2-0.5 fish/h, 0.3-0.6 fish/h, 0.1-0.3 fish/h and 0.3-0.7 fish/h, respectively). In Matagorda Bay catch rates have declined $> 50\%$ from 1975-76 (1.3 fish/h) to 1980-81 (0.4 fish/h) except during 1978-79 (1.1 fish/h). The highest seasonal mean catch rate (2.3 fish/h) of black drum occurred in 1975-76 in the lower Laguna Madre; the lowest catch rates (0.1 fish/h) occurred in 1977-78 and 1978-79 in Corpus Christi Bay. Larger black drum (383-455 mm total length) occurred in the upper and lower Laguna Madre than in the other bay systems (304-412 mm).

Black drum were caught most consistently in the 10.2- and 12.7-cm meshes in all bay systems (Tables 18-25). The lowest monthly catches (0.0 fish/h) for all meshes combined occurred in February in East Matagorda and San Antonio Bays; the highest monthly mean catch rate (2.3 fish/h) occurred in December in Aransas Bay. Mean total lengths ranged from 257 mm in May in Matagorda Bay to 474 mm in January in the upper Laguna Madre.

Sheepshead

Seasonal catch rates of sheepshead remained at ≤ 0.2 fish/h in Galveston, East Matagorda and Matagorda Bays from 1975-76 through 1980-81 (Table 1). Catch rates in other bay systems ranged from 0.1 fish/h to 1.0 fish/h, but generally remained at ≤ 0.3 fish/h. Seasonal total lengths ranged from 253 to 408 mm.

Sheepshead were caught most consistently in the 12.7- and 15.2-cm meshes (Tables 26-33). No sheepshead were caught in the 7.6-cm mesh in East Matagorda Bay, San Antonio Bay or the upper Laguna Madre. East Matagorda Bay, Matagorda Bay, San Antonio and the upper Laguna Madre had at least one month during which no sheepshead were caught. The highest mean monthly catch (1.5 fish/h) was in February in the lower Laguna Madre. The smallest sheepshead (236 mm total length) occurred in December in Matagorda Bay and the largest sheepshead (536 mm) occurred there in April.

Southern Flounder

Seasonal catch rates of southern flounder remained at ≤ 0.1 fish/h in all bay systems from 1975-76 through 1980-81 (Table 1). East Matagorda Bay had the most consistent catch rates (0.1 fish/h) for the time period. Seasonal mean total lengths ranged from 279 to 468 mm.

Southern flounder were predominantly caught in the 10.2- and 12.7-cm meshes (Tables 34-41). No flounder were caught in the 15.2-cm mesh in Galveston Bay. All bay systems except Matagorda Bay and the lower Laguna

Madre had at least one month during which no southern flounder were collected. The highest catch rate (0.5 fish/h) occurred in East Matagorda Bay during October. Mean total length ranged from 232 mm in May in San Antonio Bay to 420 mm in December in the upper Laguna Madre.

Atlantic Croaker

Seasonal catch rates of Atlantic croaker remained at < 0.1 fish/h in all bay systems from 1975-76 through 1980-81, except in 1975-76 in the lower Laguna Madre when the catch rate was 0.2 fish/h (Table 1). Mean total lengths ranged from 238 mm in East Matagorda Bay to 363 mm in San Antonio Bay.

Atlantic croaker were caught predominantly in the 7.6-cm mesh (Tables 42-49). Croaker were caught in the 15.2-cm mesh only in April in Galveston Bay and the upper Laguna Madre. Each bay system had at least two months during which no Atlantic croaker were caught. The highest monthly catch rate (3.9 fish/h) occurred in October in Corpus Christi Bay. Monthly mean total lengths ranged from 238 mm in East Matagorda Bay to 355 mm in the lower Laguna Madre.

Trammel Nets

During October-December 1980 and March-May 1981, 72 trammel net strikes were successfully completed in each bay system. Seasonal mean catch rates (no/ha and kg/ha) and mean total lengths (mm) for spring (April-May) and fall (October-November), 1977-1981 are summarized in Tables 50 and 51, respectively. Monthly catch rates and mean total lengths are summarized in Tables 52-93.

Red Drum

Red drum catches with trammel nets in each fall (October-November) were generally higher than those in the following spring (April-May) in each bay system (Table 50). Fall 1979 catch rates exceeded all other fall catch rates within each bay system except in the upper Laguna Madre where the fall 1980 catch rate was the highest. Spring 1980 catch rates exceeded all other spring catch rates within each bay system except in San Antonio Bay where the spring 1981 catch rate was the highest. The highest trammel net catch rate of red drum (7.24 fish/ha) occurred in the spring 1980 in Matagorda Bay; the lowest catch (0.10 fish/ha) occurred in the spring 1979 in the upper Laguna Madre.

Seasonal mean total lengths for red drum were larger in the spring (361-502 mm) than in the previous fall (346-459 mm) (Table 51). The fall 1979 and the spring 1980 mean total lengths in each bay system except San Antonio Bay were less than all the mean lengths within the same season for all years. In San Antonio Bay, fish caught in the fall 1980 and spring 1981 had the smallest mean total lengths.

The highest monthly mean trammel net catch rate of red drum (5.26 fish/ha) occurred in April in Galveston Bay; the lowest catch rate (0.20 fish/ha) occurred in December in Corpus Christi Bay (Table 52-58). The smallest red drum (341 mm total length) occurred in November and December in San Antonio Bay and the upper Laguna Madre, respectively; the largest monthly mean total length (509 mm) occurred in April in Galveston Bay.

Spotted Seatrout

The seasonal trammel net catch rates of spotted seatrout were generally highest during the fall in Galveston, Matagorda and San Antonio Bay and generally highest during the spring in Aransas Bay and the upper and lower Laguna Madre (Table 50). The highest seasonal catch (7.35 fish/ha) occurred in spring 1981 in the lower Laguna Madre; the lowest seasonal catch (0.20 fish/ha) occurred in spring 1979 in Galveston Bay. Seasonal mean total lengths varied among seasons and among bay systems and ranged from 398 to 578 mm (Table 51).

The highest monthly mean trammel net catch rate of spotted seatrout (9.33 fish/ha) occurred in May in the lower Laguna Madre; the lowest monthly mean catch (0.05 fish/ha) occurred in December in Galveston Bay (Tables 59-65). Monthly mean total lengths ranged from 356 mm in November in San Antonio Bay to 669 mm in December in Galveston Bay.

Black Drum

Fall trammel net catch rates of black drum were generally higher than spring catch rates in all bay systems except in Aransas and Corpus Christi Bays (Table 50). The highest seasonal catch rate (9.46 fish/ha) occurred in fall 1978 in Matagorda Bay; the lowest seasonal catch rate (0.12 fish/ha) occurred in spring 1979 in San Antonio and Corpus Christi Bays. Seasonal mean total lengths ranged from 226 to 388 mm with no apparent difference among seasons or bay systems (Table 51).

The highest monthly mean trammel net catch rate of black drum (11.83 fish/ha) occurred in December in Aransas Bay; the lowest monthly mean catch rate (0.05 fish/ha) occurred in March in Corpus Christi Bay (Tables 66-72). Mean monthly total lengths ranged from 207 mm in December in Galveston Bay to 534 mm in March in Corpus Christi Bay.

Sheepshead

Spring 1981 catch rates of sheepshead in each bay system except the upper and lower Laguna Madre exceeded the catch rates of the previous years within the same season (Table 50). The highest seasonal catch rate (9.67 fish/ha) occurred in spring 1981 in Matagorda Bay; the lowest seasonal catch rate (0.05 fish/ha) occurred in fall 1979 in the upper Laguna Madre. Seasonal mean total lengths varied among seasons and among bay system and ranged from 238 to 422 mm (Table 51).

The highest monthly mean trammel net catch rates of sheepshead occurred in October or November in each bay system except Galveston Bay (Tables 73-79). The highest monthly mean catch rate (5.29 fish/ha) occurred in October in the lower Laguna Madre; the lowest catch rate (0.00 fish/ha) occurred in May in the upper Laguna Madre. Monthly mean length ranged from 181 mm in December in Aransas Bay to 436 mm in October in the upper Laguna Madre.

Southern Flounder

Seasonal mean trammel net catch rates of southern flounder varied among seasons and among bay systems (Table 50). The highest seasonal catch rate (1.40 fish/ha) occurred in spring 1980 in Corpus Christi Bay; the lowest seasonal catch rate (0.00 fish/ha) occurred in fall 1979 in the upper Laguna Madre. Seasonal mean total lengths ranged from 202 to 399 mm generally with slightly larger fish in the fall than in the spring (Table 51).

Monthly mean trammel net catch rates of southern flounder varied among months and among bay systems (Table 80-86). The highest catch rate (1.40 fish/ha) occurred in October in Galveston Bay. The lowest catch rates (0.00 fish/ha) occurred in December in Galveston Bay and in December and March in the upper Laguna Madre. The smallest southern flounder (212 mm total length) occurred in November in Galveston Bay and in March in San Antonio Bay; the largest southern flounder (589 mm) occurred in December in the lower Laguna Madre.

Atlantic Croaker

Seasonal mean trammel net catch rates of Atlantic croaker in Matagorda, San Antonio and Aransas Bays were substantially lower than those in the other bay systems (Table 50). The highest seasonal catch rate of Atlantic croaker (11.36 fish/ha) occurred in spring 1978 in the lower Laguna Madre; spring catch rates of 0.00 fish/ha occurred in 1979 and 1980 in San Antonio Bay and in 1980 in Aransas Bay. Spring catch rates were generally higher than the fall catch rates in Galveston Bay, Corpus Christi Bay and the upper and lower Laguna Madre. The seasonal mean total length occurred over a narrow range (244-310 mm) among seasons and bay systems (Table 51).

The monthly mean trammel net catch rates of Atlantic croaker varied among months and among bay systems (Tables 87-93). The highest monthly mean catch rate (4.79 fish/ha) occurred in October in the lower Laguna Madre. All bay systems, except the upper Laguna Madre, had at least one month during which no Atlantic croaker were caught. Monthly mean total lengths ranged from 244 mm in October in Matagorda Bay to 335 mm in November in Aransas Bay.

Bag Seines

During October 1980-September 1981, 72 bag seine samples were collected in each bay system. The annual mean catch rates (no/ha) and mean total

lengths (mm) for October-September 1977-81 are summarized in Table 94. The monthly mean catch rates and mean total lengths for October 1980-September 1981 are summarized in Tables 95-100.

Red Drum

Annual mean catch rates of red drum caught with bag seines varied among years and among bay systems (Table 94). The highest annual mean catch rate (70.09 fish/ha) occurred in 1979-80 in Galveston Bay; the lowest catch rate (0.35 fish/ha) occurred in 1980-81 in the upper Laguna Madre. Annual mean lengths ranges from 50 to 178 mm.

Bag seines yielded the highest monthly mean catches of red drum in each bay system during October 1980-April 1981 (Table 95). Peak catches ranged from 4.17 fish/ha in February in the upper Laguna Madre to 22.22 fish/ha in December in San Antonio Bay. Each bay system had at least one month during which no red drum were collected. Monthly mean total lengths ranged from 31 to 343 mm. Overall mean lengths were similar in all bay systems as were the apparent increases in size from October 1980 through September 1981.

Spotted Seatrout

Annual mean bag seine catch rates for spotted seatrout varied among years and among bay systems (Table 94). The highest annual mean catch rate (39.41 fish/ha) occurred in 1977-78 in Galveston Bay; the lowest catch rate (0.34 fish/ha) occurred in 1979-80 in the lower Laguna Madre. Annual mean lengths ranged from 41 to 132 mm.

Monthly catches of spotted seatrout were generally highest during October-November 1980 and July-September 1981 in all bay systems (Table 96). The highest catch (66.67 fish/ha) occurred in October in San Antonio Bay. No spotted seatrout were collected during January, March and May in any bay system. Monthly mean total lengths ranged from 38 to 138 mm.

Black Drum

The highest annual mean bag seine catch rate of black drum (37.04 fish/ha) occurred in 1978-79 in Galveston Bay (Table 94). No black drum were caught in the lower Laguna Madre during 1977-78. Annual mean lengths ranged from 46 to 206 mm.

Monthly bag seine catches of black drum were highest in all bay systems during May-September 1981 (Table 97). Peak catches ranged from 5.56 fish/ha in San Antonio Bay to 150.00 fish/ha in the upper Laguna Madre. No black drum were caught during December 1980-March 1981. Monthly mean total lengths ranged from 40 to 322 mm. A general increase in mean monthly total lengths was apparent in each bay system during May-September.

Sheepshead

The highest annual mean bag seine catch rate of sheepshead (15.74 fish/ha) occurred in 1978-79 in Galveston Bay (Table 94). No sheepshead were caught in the upper Laguna Madre during 1977-78, 1979-80 and 1980-81. Annual mean total lengths ranged from 40 to 368 mm.

The highest monthly mean catch rate of sheepshead (16.67 fish/ha) occurred in July in Matagorda Bay (Table 98). Each bay system had at least seven months during which no sheepshead were collected. Monthly mean total lengths ranged from 27 to 407 mm.

Southern flounder

The highest annual mean bag seine catch rate of southern flounder (10.98 fish/ha) occurred in 1980-81 in the lower Laguna Madre (Table 94). No southern flounder were caught in 1978-79 in Aransas Bay. Annual mean total lengths ranged from 36 to 300 mm.

Monthly mean bag seine catches of southern flounder were generally highest in all bay systems during February-May 1981 (Table 99). The highest monthly mean catch rate (56.67 fish/ha) occurred in March in the lower Laguna Madre. No southern flounder were collected with bag seines in any bay system during November 1980-January 1981. Monthly mean total lengths ranged from 30 to 448 mm.

Atlantic croaker

Annual mean bag seine catch rates of Atlantic croaker ranged from 0.35 fish/ha in 1980-81 in the upper Laguna Madre to 1086.92 fish/ha in 1979-80 in Galveston Bay (Table 94). Higher annual catch rates generally occurred in Galveston Bay, Matagorda Bay and the lower Laguna Madre than in other bay systems. Annual mean total lengths ranged from 40 to 104 mm.

Monthly mean bag seine catches of Atlantic croaker were generally highest in all bay systems during January-June 1981 (Table 100). The highest monthly mean catch rate (3244.45 fish/ha) occurred in March in Galveston Bay. No Atlantic croaker were collected with bag seines during October-November 1980. Monthly mean total lengths ranged from 32 to 220 mm. Generally the smallest fish were collected during the months of greatest catches, and lengths increased from January through June.

Appendix A Bay Systems Area Descriptions

AREA DESCRIPTIONS

Descriptions of each bay system except the East Matagorda Bay system were reproduced from Matlock et al. (1978).

Galveston Bay

The Galveston Bay system, which includes 353,768 acres, is the largest estuary on the Texas coast (Fisher et al. 1972) and consists of Galveston,

Trinity, East, West, Dickinson, Chocolate, Christmas, Bastrop, Dollar, Drum and Tabbs Bays and Clear, Moses and Jones Lakes (Fig. 1a-b).

The estuary is separated from the Gulf of Mexico by Bolivar Peninsula, Galveston Island and Follets Island. Two natural passes, Bolivar Roads and San Luis Pass, and one man-made pass, Rollover Pass, connect the estuary with the Gulf.

Bay depths average 6.9 ft or less except in dredged channels. Bolivar Roads, Houston, Texas City, Galveston and Bayport Ship Channels are dredged to 40 ft. The Intracoastal Waterway is dredged to 12.1 ft through East, lower Galveston, and West Bays (Diener 1975).

Bay substrates include mud, shell and clay; barrier island shorelines are predominately sand. Approximately 7,527 acres of oyster reefs lie in Galveston, Trinity, East, West and Dickinson Bays (Benefield and Hofstetter 1976). Numerous spoil "islands" occur along most dredged channels.

Shoreline marshes are present along portions of East, West, Trinity, Christmas, Bastrop, Drum and Chocolate Bays. Diener (1975) listed 231,342 acres of emergent vegetation--smooth cordgrass (Spartina alterniflora), salt meadow cordgrass (S. patens), bulrush (Scirpus olneyi), shoregrass (Monothochloe littoralis), rush (Juncus romerianus), seashore saltgrass (Distichlis spicata) and saltwort (Batis maritima)--and 18,095 acres of submergent seagrasses--widgeon grass (Ruppia maritima) and Holodule beaudettei--in Galveston Bay. McEachron, Shaw and Moffett (1977) reported Halophila engelmanni and turtle grass (Thalassia testudinum) in Christmas and Bastrop Bays.

The bay receives an average 2642 billion gal of fresh water annually, 90% of which comes from the Trinity and San Jacinto Rivers (Environmental Protection Agency 1971). Diener (1975) reported salinities ranging from 5-15 o/oo in Trinity and upper Galveston Bays to 20-30 o/oo in the lower portions of Galveston Bay near the Gulf. From November 1975 through March 1976 bay salinities at gill net stations ranged from 2.2 to 28.9 o/oo, dissolved oxygen varied from 5 to 18 ppm and water temperatures ranged from 40.1 to 76.1 F (Texas Parks & Wildlife Dept., Seabrook, Texas).

The Galveston Bay complex is adjacent to the most populated and industrialized area of Texas. A population of 2,424,800 people reside in the eight counties bordering the bay (1974 Census Data, Houston--Galveston Area Council, personal communication). The highest concentrations of people and industrial complexes are on the western shores of Galveston Bay and the eastern shores of West Bay. From 1967 to 1969 the daily average flow of domestic wastewater into the Galveston Bay complex was at least 16.7 million gal and the industrial wastewater inflow at least 300 million gal (Diener 1975).

Sport fishermen caught an estimated 2,774,297 lb of fish in the bay from September 1974 through August 1975 (Heffernan et al. 1977). The commercial fishing industry harvested over 45.1 million lb of shrimp worth \$38,000,000, 15.4 million lb of blue crabs worth \$1,700,000, 6.6 million lb of finfish worth \$1,200,000, 21.4 million lb of shelled oysters worth \$11,700,000 and 9.3 million lb of small bait shrimp worth \$11,100,000 (O. B. Lynam, Texas Parks & Wildlife Dept., Seabrook, Texas, Unpublished data).

East Matagorda Bay

East Matagorda Bay (Fig. 2) is a relatively shallow (3.4 ft average depth), medium to high salinity (15-30 o/oo), turbid bay with a surface area of 37,810 acres at mean low water (MLW) (Diener 1975).

The bay's only connection with the Gulf of Mexico has historically been Brown Cedar Cut at the east end. Caney Creek and the Colorado River delta mark the northeast and southwest boundaries, respectively. The Matagorda Peninsula forms the southern boundary while the Intracoastal Waterway borders the northern shoreline of East Matagorda Bay.

Extensive stands of emergent cordgrass (Spartina sp.) occur along both the southern and northern boundaries with rush found on the northern shoreline. Submergent grasses include widgeon grass and Halodule beaudettei.

Oyster reefs are located throughout the system but no estimate of the acreage was available.

East Matagorda Bay receives fresh water from rainfall and runoff entering the Intracoastal Waterway from Caney Creek, the Colorado River and Peyton Creek (via Lake Austin and Live Oak Bayou). No estimates of the amount of annual fresh water inflow were available.

Population centers are located at each end of the bay in Matagorda (population 700) and in Sargent (population unknown). Fishing comprises the major activity of residents in both towns; however, information concerning commercial and recreational landings has been combined with data from the Matagorda Bay system.

Matagorda Bay

The Matagorda Bay system (Fig. 3) encompasses an area of 244,430 acres and has an average depth of about 6.9 ft at MLW (Diener 1975). It includes Tres Palacios, Turtle, Carancahua, Lavaca, Cox, Keller and Chocolate Bays and Oyster, Redfish, Salt and Powderhorn Lakes.

Matagorda Bay is a large primary bay of 167,529 acres and 7.9 ft mean depth (Diener 1975). The southern boundary is the long, narrow Matagorda Peninsula with sand shoreline and extensive areas of submergent and emergent grasses; the eastern confine is the Colorado River delta and the western boundary is a shallow sand shoreline with limited submergent and emergent vegetation. The community of Port O'Connor (population 1,400) is in the southwest corner. Several secondary and tertiary bays associated with major and minor drainages into Matagorda Bay indent the northern perimeter.

Oyster Lake is a shallow muddy tertiary system of 2335 acres and 2.6 ft mean depth (Diener 1975) located along the northwestern shoreline of Matagorda Bay. Numerous oyster reefs are located throughout the system and the periphery is surrounded by emergent vegetation. Tres Palacios Bay is a secondary system of 9436 acres and 3.9 ft mean depth (Diener 1975) with oyster reefs and scattered shell throughout. The community of Palacios (3,500 people) is located on the northern shoreline. Turtle Bay, with 1280 acres and 2.6 ft mean depth (Diener 1975), is a muddy system with a moderate number of oyster reefs. The

shoreline is primarily clay bluffs with scattered emergent vegetation communities.

Carancahua Bay, along the north central shoreline of Matagorda Bay, covers 13,076 acres and has a 3.9-ft mean depth (Diener 1975). Several resort communities (Port Alto, Schicke Point and Cape Carancahua) are located along the bay. This bay has little marsh except in the southern portion where the tertiary systems of Redfish and Salt Lakes are located. Steep banks and sandy clay constitute the majority of the shore areas.

Lavaca Bay is a large secondary bay in the northwest corner of Matagorda Bay with 44,729 acres and 4.3-ft mean depth (Diener 1975). The shoreline is primarily clay bluffs. On the southeastern shoreline of Lavaca Bay are two smaller secondary areas: Cox Bay and Keller Bay. Cox Bay is a shallow muddy system with a clay bluff periphery and scattered oyster reefs throughout. Keller Bay is a deeper system and the southern perimeter has the largest submerged grass beds found in the Lavaca Bay complex. The community of Olivia (240 people) is located at the head of Keller Bay. On the western shoreline of Lavaca Bay is Chocolate Bay, a small, muddy bay of 699 acres and 2.6-ft mean depth with clay bank shoreline (Diener 1975). North of Chocolate Bay is the city of Port Lavaca (12,000 people). The area of central Lavaca Bay is the most heavily industrialized in the Matagorda Bay system.

South of Lavaca Bay, on the western shoreline of Matagorda Bay, is Powderhorn Lake. This is a moderately saline, shallow body of water of 2889 acres and 2.3-ft mean depth (Diener 1975). This "lake" connects with Matagorda Bay through Powderhorn Bayou on which the community of Indianola (200 people) is located. The periphery of this bay is surrounded by large emergent grass communities.

There are two direct exchanges with the Gulf of Mexico, Pass Cavallo and the Matagorda Ship Channel, both located in the southwest corner of Matagorda Bay, and one indirect connection, the Colorado River, on the eastern boundary. The western portion of Matagorda Bay and the southern two-thirds of Lavaca Bay are transected by the Matagorda Ship Channel, 35.4 ft deep (Diener 1975), with associated spoil banks. The channel originates at the ALCOA (Aluminum Company of America) plant on the eastern shoreline of Lavaca Bay and terminates at the Gulf of Mexico through the Matagorda jetties. Small channels branch off in Lavaca Bay to the Refuge Harbor at Port Lavaca and to the Lavaca River. The Intracoastal Waterway, dredged to 12.1 ft (Diener 1975), intersects the Matagorda Ship Channel near Port O'Connor. The Palacios Ship Channel branches from the Intracoastal Waterway in south central Matagorda Bay.

Diener (1975) listed 119,970 acres of emergent vegetation--smooth cordgrass, salt meadow cordgrass, saltwort, shoregrass and coastal dropseed (Sporobolus virginicus)--and 7037 acres of submergent vegetation (widgeon grass and Halodule beaudettei) in the Matagorda Bay system.

Between 1957 and 1968 Matagorda Bay received an average 713 billion gal of freshwater discharge annually (Diener 1975), mainly through the Tres Palacios, Carancahua, Lavaca and Navidad Rivers with partial flow entering the bay from the Colorado River. From November 1975 through March 1976, bay water salinities at gill net stations ranged from 10.0 to 28.0 o/oo, dissolved oxygen varied from 6.0 to 13.0 ppm and water temperatures ranged from 44.6 to 78.8 F (Texas Parks & Wildlife Dept., Palacios).

Sport fishermen caught an estimated 844,600 fish weighing 968,832 lb in Matagorda Bay from September 1975 through August 1976; during the same period commercial fishermen landed 176,370 lb of fish (Breuer et al. 1977).

San Antonio Bay

The San Antonio Bay system consists of the primary bays San Antonio and Espiritu Santo and the secondary bays Hynes, Guadalupe and Shoalwater (Fig. 4). Several large natural saltwater lakes occur along Matagorda Island and connect with the primary bays via sloughs and small passes. Two major passes, Cedar Bayou Pass to the west and Pass Cavallo to the east, provide circulation routes between the Gulf of Mexico and the bay system.

San Antonio, Hynes and Guadalupe Bays cover approximately 84,012 acres and Espiritu Santo Bay covers 34,099 acres for a total bay system area of 118,111 acres (Collier and Hedgpeth 1950). The average depths of the unaltered bay system are 3.9 ft in San Antonio Bay (maximum of 7.6 ft) and 4.9 ft in Espiritu Santo Bay (maximum of 7.9 ft) (Collier and Hedgpeth 1950).

Bottom substrates are generally silty clay and sand in the upper bay region which gradually change to sand clay and sand in the lower bay and Espiritu Santo bay regions (Texas Parks & Wildlife 1975). Approximately 3015 acres of spoil islands and 2001 acres of oyster reefs occur in the bay system (Burg 1974). One of the major oyster reefs is Panther Reef which extends from Panther Point north toward Mosquito Point.

The Guadalupe and San Antonio Rivers are the major sources of fresh water for the San Antonio Bay system, providing an average annual inflow of 449 billion gal from a drainage area of 6,559,920 acres (Childress et al. 1975). The amount of fresh water entering the system generally depends upon rainfall in the upland drainage rather than on local drainage. Local rainy periods usually occur during early summer and fall. The average annual rainfall for the area is 33.9 inches (Texas Parks & Wildlife 1975).

Salinity values for the bay system generally increase as the distance from the rivers increases. Out-flowing fresh water moves along the west shore of San Antonio Bay while incoming Gulf water moves along the east shore (Childress et al. 1975). Average surface salinities range from 0.0 o/oo in Guadalupe Bay to about 8.0 o/oo in lower San Antonio Bay and from 14.0 to 21.0 o/oo in Espiritu Santo Bay (Childress et al. 1975). No seasonal turbidity patterns are noted within the bay system; however, turbidities tend to increase toward the upper bay and river-influenced areas, as well as in areas disturbed by mud-shell and channel dredging operations (Childress et al. 1975). Dissolved oxygen concentrations increase during cold months and decrease during warm months. Between May 1972 and August 1973, average dissolved oxygen concentrations ranged from 7.0 to 12.4 ppm (Childress et al. 1975).

About 24,993 acres of emergent and 16,345 acres of submergent vegetation are found in the San Antonio Bay system (Diener 1975). Smooth cordgrass is the dominant emergent plant in all areas of the bay system except in upper San Antonio Bay where common reed, Phragmites communis, is dominant (Childress et al. 1975). Other species of emergent vegetation include saltwort, saltgrass, shoregrass and salt meadow cordgrass (Diener 1975). The dominant submergent vegetation of the San Antonio Bay system is shoal grass, Diplanthera wrightii.

This plant is located primarily in the low turbidity areas of lower San Antonio Bay and Espiritu Santo Bay and in the shallow lakes and sloughs found along the northern margin of Matagorda Island. Other species of submergent vegetation found in the bay system include widgeon grass, and the algae Polysiphona gorgoniae, Spyridia filamentosa, Gracilaria folifera, Ulva lactuca and U. fasciata (Childress et al. 1975). The algae are usually found attached to submerged solid objects such as oyster shells or pilings. However, some algae can be found in calm areas attached to mud or sand substrates.

Four small towns occur on the shoreline of the San Antonio Bay system: Austwell, Long Mott, Seadrift and Port O'Connor. Less than 4,000 inhabitants live in these four communities combined (1970 census). The primary businesses found in this area are farming, ranching and fishing, including shrimping and oystering. The majority of the bay shoreline as well as the San Antonio-Guadalupe River drainage occurs on or near ranchland and farmland. Two major industries exist on the San Antonio Bay system; Union Carbide Corporation at Long Mott and DuPont de Nemours E.I. & Company at Bloomington, a town on the Guadalupe River approximately 20 miles from the bay.

The tourist industry is not very extensive, but a few fishing centers at Seadrift and Port O'Connor furnish tackle, guides and access to the bay system. Most of the sport fishing occurs in Espiritu Santo Bay. Between September 1974 and August 1975, sport fishermen harvested an estimated 416,453 lb of fish from the entire bay system; commercial fishermen harvested an estimated 482,592 lb of fish (Heffernan et al. 1977). In addition, approximately 883,172 lb of shrimp, 1,125,239 lb of blue crabs and 196,873 lb of oysters were harvested commercially during the 1974 calendar year (O. B. Lynam, Texas Parks & Wildlife Dept., Seabrook Field Station, personal communication).

Aransas Bay

The Aransas Bay complex consists of primary, secondary and tertiary bays. The system extends from Aransas Pass, Texas, northeastward to Mesquite Bay, and from its eastern boundary of San Jose Island, westward across Copano Bay to the small community of Bayside, Texas (Fig. 5).

Aransas Bay is the primary bay with a surface area at MLW of 56,207 acres and an average depth of 7.9 ft (Diener 1975). A direct water circulation and marine life migration route from the Gulf of Mexico to the bay is provided by a deep water (45.0-46.9 ft) pass, 600 to 712 ft in width, between San Jose Island and Mustang Island at Port Aransas, Texas (Anonymous 1971). This accounts for the higher than average salinities in the southern region of the bay (approximately 30 o/oo). The middle of the bay is the deepest part with a maximum value of 13.1 ft at MLW (U. S. Dept. Commerce 1976a). Six major oyster (Crassostrea virginica) reefs ranging in area from 25 to 257 acres are concentrated in the northern portion of Aransas Bay, along with scattered smaller reefs (Heffernan 1961). There are no private oyster leases in the Aransas Bay system (Diener 1975).

Copano, St. Charles, Redfish and Dunham Bays are considerably shallower, secondary areas, supporting extensive growths of algae and "grasses", which provide valuable nursery grounds for juvenile fish and crustaceans (Heffernan 1972a). Nutrient circulation in these bays is generally affected by freshwater runoff as well as by tidal fluctuations.

Copano Bay is the largest secondary bay with 41,730 acres of surface water and an average depth of 3.6 ft with a maximum depth of 8.9 ft (Diener 1975). The Mission and Aransas Rivers flow into the bay with respective discharges of 733.3 and 65.0 gal/s (Diener 1975).

Copano Bay has five large oyster reefs, ranging in size from 22 to 42 acres, plus a compliment of smaller reefs (Heffernan 1961). The transverse position of a few of the reefs near the mouth of Copano Bay dampen tidal action in much of the bay (Collier and Hedgpeth (1950).

The narrow St. Charles Bay, extending between Lamar Peninsula and the Aransas National Wildlife Refuge, has a surface area of 8408 acres with a 3.6-ft average depth (Diener 1975). Freshwater flow from five creeks enters the bay along its northern reaches. Nearly the entire bay is considered prime nursery ground (Heffernan 1972a).

Redfish and Dunham Bays, at the southern and northern ends, respectively, of Aransas Bay, are also very shallow nursery areas but these bays do not receive direct freshwater flow. Redfish Bay is densely vegetated while Dunham Bay is a muddy, sparsely vegetated area.

Tertiary nursery grounds are located principally in the lower regions of creeks and streams which enter the secondary bays. Port Bay with 1651 acres extends southward from Copano Bay and receives freshwater from creek drainage at its southern tip (Diener 1975).

Mission Bay and lower Mission River with nearly 3939 acres and located off the northwest shore of Copano Bay are the most valuable nursery grounds of the tertiary areas (Heffernan 1972b).

Copano Creek harbors a small portion of nursery grounds in the northwest corner of Copano Bay (Heffernan 1972a).

Tertiary regions of Chiltipin Creek and the Aransas River system are located along the western shore of Copano Bay (Heffernan 1972a).

The Aransas Bay system contains 137,514 acres of water (Heffernan 1972a) of which 44,989 acres are occupied by eight major species of emergent vegetation--saltwort, shoregrass, glassworts (Salicornia sp.), smooth cordgrass, salt meadow cordgrass, coastal dropseed, sea purselane (Sesurium portulacastrum) and seashore saltgrass--and 4,124 acres by three major species of submerged vegetation--(Halodule beaudettei), widgeon grass and turtle grass (Diener 1975; W. E. Mercer, TPWD, Personal Communication).

The climate of this area varies from semi-arid to dry sub-humid. Southeast winds are dominant most of the year but from December through February northerly winds associated with advancing cold fronts are common (Whitehouse and Williams 1953). Winters in the Aransas Bay system produce the lowest average monthly water temperatures (59.2 F) and rainfall (0.8 inch). Water temperatures increase through the spring (70.9 F), reach the highest values in the summer (83.7 F) and decline through the fall (73.6 F). Rainfall is greatest in the fall (6.4 inches). The amounts of rainfall in spring and summer average about 2.6 inches. Salinity values are inversely related to rainfall with the lowest salinity (14.1 o/oo) occurring in the fall. The highest salinity occurs in spring (26.8 o/oo). Dissolved oxygen, pH and

turbidity remain relatively constant throughout the year with average values of about 7.0 ppm, 8 and 50 Jackson Turmidity Units (JTU), respectively (Martinez 1970, 1971).

Water movement in the bay system is strongly influenced by wind action. Generally, however, the surface waters take a serpentine course, flowing during a falling tide from Copano Strait south toward Mud Island where there is a clockwise eddy which tends to return the bay water northward along the face of the more saline water from below Mud Island. On a strong rising tide this water is pushed east so that the eddy constricts into an ellipse (Collier and Hedgpeth 1950). The average tidal range for Aransas Bay is 0.49 ft (Diener 1975).

Mud is the predominant bottom sediment of the Aransas Bay system except along the sandy western shore of San Jose Island (Diener 1975).

The average total weight of finfish caught per year by commercial fishermen in the Aransas Bay system during the period 1969-1971 was 573,612 lb (Martinez 1970, 1971). The annual average harvest of commercially caught shrimp and crabs during the same period was 816,991 lb and 420,827 lb respectively.

Along the 230 miles of shoreline of the Aransas Bay system, the only communities of notable size are Lamar, Bayside, Fulton, Rockport and, the largest, Aransas Pass which has a population of about 6,000.

There are three domestic but no industrial waste outfalls in the bay system. Previous high discharges of toxic oilfield brine into Chiltipin Creek and the Mission River were ordered ceased in 1973 by the Texas Railroad Commission (Heffernan 1972b). A total of 14,796 acres in the Aransas Bay system are now closed to shellfishing by the Texas Board of Health (Diener 1975) because of domestic sewage problems.

Corpus Christi Bay

The Corpus Christi Bay system, composed of Corpus Christi, Nueces, lower Redfish and Oso Bays, is located on the lower third of the Texas Gulf coast between longitude 97° 02' and 97° 32' W and latitude 27° 41' and 27° 55' N (Fig. 6). It is bordered on the northeast by upper Redfish Bay, on the east by Mustang Island and on the south by the upper Laguna Madre. The city of Corpus Christi forms the western boundary of Corpus Christi Bay. Nueces Bay, the former coastal lagoon for the Nueces River basin, is positioned on an east-west axis, entering Corpus Christi Bay at the northwest corner, just north of Corpus Christi. The southern half of Redfish Bay separates Aransas from Corpus Christi Bay and enters Corpus Christi Bay in the northeast quadrant. Oso Bay, the semi-enclosed drainage area for Oso Creek, joins Corpus Christi Bay in the southwest quadrant.

The entire Corpus Christi Bay system has an area of 124,796 acres with 127 miles of shoreline. Corpus Christi Bay is the largest of the four bays in the system, having a total surface area of 95,997 acres. Nueces Bay has an area of 19,518 acres, Oso Bay covers approximately 17,095 acres and lower Redfish Bay covers approximately 5258 acres. The average depth of Corpus Christi Bay is 11.2 ft; Nueces, Oso and lower Redfish Bays average 2.0 ft in depth (Collier and Hedgpeth 1950, Hood 1953, Stevens 1959).

Sediment composition in Corpus Christi Bay ranges from fine sand to black mud. A mixture of gray clay and black mud is the dominant bottom type for the area. Brown silt occurs in areas of channelization while hard sand and fine shell can be found adjacent to Mustang Island.

Submergent vegetation is sparse in Corpus Christi Bay, except along its eastern shore where shoal grass and widgeon grass dominate. Emergent vegetation, found throughout the bay complex, consists primarily of saltwort, glassworts, shoregrass, smooth cordgrass, coastal dropseed, seablite, Suaeda linearis, sea oats, Uniola paniculata and saltmarsh bulrush, Scirpus maritimus. In Corpus Christi Bay, 19 oyster reefs total 563 acres and are confined primarily to the western and northern portions. Oysters occur throughout Nueces Bay (Stevens 1959, 1960; Diener 1975). The primary sources of freshwater inflow into the Corpus Christi Bay system are Oso Creek and the Nueces River. Prior to the construction of Wesley Seale Dam at Mathis, Texas, in 1958, the Nueces River averaged 20 billion gal of discharge per year. The reservoir furnishes the industrial and municipal freshwater needs for the city of Corpus Christi and surrounding towns. Freshwater inflow to Nueces and Corpus Christi Bays is now limited to periods of dam overflow and heavy land runoffs (Stevens 1959).

Prior to 1972, the primary source for water exchange between Corpus Christi Bay and the Gulf of Mexico was the Corpus Christi Channel. This ship channel extends approximately 18 miles from the Port of Corpus Christi to its intersection with the Aransas Ship Channel, which continues for approximately 1 mile to the Gulf of Mexico. The two channels are maintained at an average depth of 40.0 ft (U. S. Dept. Commerce 1974). Since its completion in 1972, the Corpus Christi Fish Pass has provided intermittent water exchange through the upper Laguna Madre, but in recent years this has only occurred in association with hurricane winds and tides. Water exchange for Corpus Christi Bay with lower Redfish Bay and the upper Laguna Madre takes place primarily through the Intracoastal Waterway and on a limited basis across the shallow flats during high tides.

The climate for the area is intermediate between the semi-arid regions to the west and southwest and the humid subtropical region to the northeast. For the period 1936-1975 the mean annual air temperature was 71.2 F and the mean annual rainfall was 28.5 inches (NOAA 1975).

The general water circulation pattern for the Corpus Christi Bay system is a counterclockwise movement along the shoreline (Stevens 1959). The predominant winds, generally from the southeast year-round with occasional "northerns" in the winter, and the irregular lunar tides, have the greatest overall influence on the bay water movement. For the period 1968-1972, the mean salinity and the mean water temperature for the entire Corpus Christi Bay system was 26.1 o/oo and 73.4 F, respectively (Martinez 1968, 1969, 1970, 1971 and 1972). The mean turbidity for the same period was 43 JTU, although the mean for Nueces Bay during 1971 and 1972 was 107 JTU.

The entire system lies within Nueces County, Texas. The county, with an area of 536,301 acres, had a population of 237,544 persons as of the 1970 census. The City of Corpus Christi had a population estimate of 204,525 (Diener 1975). Extensive oil and gas exploration has resulted in numerous well platforms and submerged pipelines throughout Nueces and lower Redfish Bays and along the western shore of Corpus Christi Bay. Heavy industrialization

has occurred along the south shore of Nueces Bay and the north shore of Corpus Christi Bay in the area of La Quinta Channel.

Upper Laguna Madre

Located on the lower Texas coast between latitudes $27^{\circ} 10'$ and $27^{\circ} 41'$ the upper Laguna Madre system consists of the upper Laguna Madre and the Baffin Bay system (Fig. 7). The upper Laguna Madre is a long (approximately 41 miles), narrow (9.8 miles) and shallow (average depth 3.3 ft) lagoon extending from the Kenedy Land Cut to Corpus Christi Bay (Simmons 1957; Diener 1975; U. S. Dept. Commerce 1976b). Bordered on the east by Padre Island and on the west by the city of Corpus Christi and the King and Kenedy Ranches, the upper Laguna Madre covers approximately 47,228 acres at MLW (Diener 1975).

This long, narrow coastal lagoon is bisected imperfectly by the Intra-coastal Waterway, which is 124.7 ft wide and 12.1 ft deep. Spoil banks from this canal form a dike 13 miles long effectively dividing the northern part of the bay. Beyond this point, spoil banks are staggered and the division is less effective (Simmons 1957). The northern end of the lagoon is restricted by a land fill causeway which has three openings totaling about 899 ft in width at MLW. The southern end is restricted by a land fill through which the Intra-coastal Waterway extends.

The upper Laguna Madre is joined in the southern portion by the equally large Baffin Bay system--consisting of Baffin Bay, Alazan Bay, Laguna Salada, Cayo del Grullo and Cayo del Infernillo--which covers an estimated 54,117 acres. Baffin Bay, the central and largest bay of the group, is a narrow body of water, 19 miles long and 5 miles wide, bisected laterally by the demarcation line of Kleberg-Kenedy Counties (Breuer 1957). The average depth in Baffin Bay is 7.9 ft at MLW, with a maximum depth (MLW) of 12.1 ft near the entrance to the Laguna Madre (Breuer 1957, Diener 1975). There are approximately 31,861 acres of surface area (MLW) in Baffin Bay.

Alazan Bay, entirely within Kleberg County and the King Ranch, extends approximately 15 miles northeasterly to the mouth of Petronilla Creek (Breuer 1957, Diener 1975). The average water depth (MLW) in Alazan Bay is approximately 3.0 ft. The surface area of Alazan Bay is approximately 13,867 acres.

Cayo del Infernillo is a shallow slough (0.7 ft) extending westward from the west shore of Alazan Bay whose water surface at MLW covers 699 acres (Breuer 1957, Diener 1975).

Baffin Bay is joined by two small tertiary bays--Laguna Salada entering from the west and Cayo del Grullo from the northwest. Both bays have an average water depth (MLW) of 3.0 ft. Laguna Salada covers approximately 3227 acres and Cayo del Grullo about 4470 acres.

The upper Laguna Madre, with restricted openings at either end, no constant openings into the Gulf of Mexico and limited freshwater inflow, has been characterized as a hyperhaline estuary (Simmons 1957, Breuer 1962a), with salinities of 50-60 o/oo common. The Intracoastal Waterway provides for limited water exchange at both ends of the lagoon. Since the dredging of the Intracoastal Waterway salinity "has neither risen above 80 o/oo in the lagoon nor in Baffin Bay (where 100 o/oo was formerly not uncommon), nor have waters of very low salinity remained in the area any length of time" (Simmons 1957).

The only substantial source of freshwater is runoff from the Kenedy, Kleberg, Jim Wells and Nueces County watersheds into the Baffin Bay system (Breuer 1957). The dry sand on Padre Island absorbs rain very rapidly and the very gradual slope of the lagoon's western shore makes these areas poor watersheds (Simmons 1957).

The upper Laguna Madre system lies in two climatic zones--north of Baffin Bay is sub-humid; south of that point is semi-arid (Simmons 1957). Rainfall in the area is highly variable but averages 27.0-29.1 inches annually (NOAA, Env. Data Svcs., Natl. Climatological Center, Ashville, N. C. 1976). Annual average surface water temperatures for the period 1969-1972 ranged from 73.6 to 76.3 F in the upper lagoon (Martinez 1969, 1970, 1971 and 1972). No data concerning water temperature from Baffin Bay is available. Southeast or south-southeast winds are prevalent during most of the year and are directly responsible for the water circulation in the system (Simmons 1957). Water in the upper lagoon is generally clear (annual average turbidity during 1969-1972 ranged from 36.8 to 45.6 JTU) (Martinez 1969, 1970, 1971 and 1972); while water in Baffin Bay is often turbid and at times becomes a dark brown (Breuer 1957).

The bottom in the upper lagoon consists primarily of quartzose sand, silt and shell with some calcareous sand or mud in isolated areas (Simmons 1957). In the Baffin Bay system bottom types of soft mud, soft and hard clay, sand and concentrated shell (mostly Mulinia lateralis) can be found. Also, in Baffin Bay and near the junction of Baffin Bay and the upper Laguna Madre are extensive rock formations consisting of serpulid worm tubes, calcareous and quartzose material.

Simmons (1957) and Breuer (1957) reported dense vegetation--shoalgrass and widgeon grass--restricted to the northern one-third of the lagoon. They indicated that the remainder of the system has only sparse to moderate vegetation, with the exception of the area near the entrance to Baffin Bay and areas around spoil islands.

The only substantially populated center adjacent to the upper Laguna Madre is Corpus Christi, Texas, with a population of 204,525 (U. S. Dept. Commerce 1970a). An additional 33,166 people in Kleberg County (U. S. Dept. Commerce 1970b) are located near the Baffin Bay system.

Industrialization in the area has been held to a minimum because of limited access to the surrounding land. The only major industry in the system is a public utility (Central Power and Light Co.) which displaces approximately 3.3 million gal of water/min from the upper Laguna to Oso Bay (Mr. M. L. Sheperd, Central Power and Light Co., June 1976, Personal Communication). Most of the area surrounding Baffin Bay is private ranchland and consequently there is little urban development. There is considerable oil and gas development on these ranches, resulting in large quantities of oilfield brine production. In most cases the brine has been discharged into the bay or a creek which leads to the bay. Mackin (1971) reported that approximately 2,728,897 gal of oilfield brine is discharged each day into Petronilla Creek and thence into Alazan and Baffin Bays.

Lower Laguna Madre

The lower Laguna Madre is a long shallow bay that extends 55 miles northward from Port Isabel to the Kenedy Land Cut (Fig. 8). It varies from 3 miles

to 7.8 miles wide and is imperfectly bisected by the Intracoastal Waterway. The bay is bounded on the west by the Texas mainland and on the east by Padre Island and contains approximately 182,809 acres (Stokes 1974). Passes to the Gulf of Mexico are located near Port Isabel and east of Port Mansfield. Limited amounts of fresh water (average of 818.9 gal/s) enter lower Laguna Madre from the Arroyo Colorado and North Floodway (Bryan 1971).

Except for the Intracoastal Waterway with an average depth of 12.0 ft, the deepest areas are found in the northern and southern portions of the bay (Breuer 1962a). In the northern section, which extends from Port Mansfield to the Kenedy Land Cut, water depth is as much as 7.9 ft. From Port Mansfield south to Three Islands the water is shallow with most locations being < 3.0 ft deep. South of Three Islands the maximum water depth is 5.9 ft and water depths of 3.9-4.9 ft are prevalent.

Bottom types consist of sand, silty sand or a combination of sand, silt and clay (Shepard and Rusnak 1957). Shell is not commonly found in lower Laguna Madre. In general, sediments are coarser along the eastern or Padre Island side of the bay than along the western or mainland side of the bay.

Shoalgrass is the most common type of vegetation found in lower Laguna Madre (Stokes 1974). Dense stands of shoalgrass can be found in shallow water along most of the shoreline as well as in the entire middle portion (Port Mansfield to Three Island) of the bay. Light to dense stands of manatee grass (Cymodocea filiforme), turtle grass, widgeon grass, Halophila engelmannii and Acetabularia crenulata can be found scattered throughout the bay.

Hydrological parameters have been described by Stokes (1974). Average monthly salinities range from 16.0 to 41.0 o/oo. Excluding the Arroyo Colorado and North Floodway, salinities as low as 10.5 o/oo and as high as 44.9 o/oo are sometimes encountered. Average monthly bottom water temperatures range from 62.6 F during some winter months to 81.5 F in August. Turbidity values are generally highest from Port Mansfield to Three Islands (the shallowest portion of the bay). The average annual turbidity value in this region is 45 JTU. North of Port Mansfield the average turbidity is 28 JTU and south of Three Islands the average is 32 JTU.

The total population for the counties bordering lower Laguna Madre is 162,608 (Harlingen Chamber of Commerce). In 1973, 1,278,000 out-of-state residents visited the lower Rio Grande Valley. Although there are no figures available, it is probable that many of these people visited this area because of water related activities in lower Laguna Madre. Farming and ranching are the main industries along the bay. The only area of heavy industry is the Brownsville Ship Channel where several shrimp processing plants, a Union Carbide plant, a grain elevator, three ship dismanteling plants, two oil loading docks and an oil rig construction company are located.

Appendix B Gill Net Station Locations

Table 1 . Gill net station locations in each bay system, October 1980-September 1981.

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Galveston	Galveston	1	29° 32' 05"	95° 00' 35"	1.0 mile SE of Clear Creek entrance channel
Galveston	Galveston	2	29° 30' 50"	95° 59' 00"	0.3 mile W of surfaced ramp in Bacliff, Texas
Galveston	Galveston	3	29° 30' 20"	94° 57' 05"	0.3 mile E of HL & P Company's P. H. Robinson Generation Station's discharge canal
Dicinson	Dickinson	4	29° 28' 00"	94° 57' 30"	N shoreline of Dickinson Bayou
Dicinson	Dickinson	5	29° 27' 45"	94° 56' 40"	0.5 mile SE of junction of Dickinson Bayou and Bay
Moses Lake	Moses Lake	6	29° 26' 10"	94° 56' 10"	NW shore of Moses Lake
Moses Lake	Moses Lake	7	29° 25' 40"	95° 57' 05"	NW of Mouth of Moses Bayou
Moses Lake	Moses Lake	8	29° 25' 20"	94° 56' 20"	S shore of Moses Lake
Galveston	Galveston	9	29° 26' 25"	95° 54' 10"	1.0 mile W of Dollar Point
Galveston	Galveston West	10	29° 24' 15"	95° 54' 15"	0.8 mile N of Texas City Dike
Galveston	Galveston West	11	29° 18' 00"	94° 56' 50"	0.2 mile NE of Brasford Bayou
Galveston	Galveston	12	29° 20' 35"	94° 53' 40"	0.5 mile N of Campbell Bayou
Galveston	Galveston	13	29° 20' 00"	94° 53' 50"	SE of Campbell Bayou
Galveston	Galveston	14	29° 19' 20"	94° 53' 35"	0.8 mile SE of Campbell Bayou
Jones Lake	Jones Lake	15	29° 18' 45"	94° 55' 45"	0.6 mile E of Highland Bayou
Jones Lake	Jones Lake	16	29° 17' 25"	94° 56' 05"	N shore of Spoil Island, ICWW Marker 54
West	West	17	29° 16' 40"	94° 58' 35"	SE shore of spoil bank, 0.9 mile NE of Greens Cut
Greens Lake	Greens Lake	18	29° 15' 45"	94° 59' 55"	SW shore of Greens Lake, 0.3 mile W of mouth
Greens Lake	Greens Lake West	19	29° 16' 35"	94° 59' 35"	Greens Lake, NE of mouth
Greens Lake	Greens Lake West	20	29° 16' 05"	94° 59' 05"	SE shore of spoil bank W of Greens Cut
West	Carancahua Lake	21	29° 14' 15"	95° 00' 55"	0.2 mile SW of Carancahua Cut
Carancahua Lake	Carancahua Lake	22	29° 14' 20"	95° 01' 35"	S shore of Carancahua Lake
West	Carancahua Point	23	29° 13' 10"	95° 01' 45"	Carancahua Point

San Antonio	San Antonio	81	28°13'40"	96°47'05"	1 mile S of False Live Oak Pt.
San Antonio	San Antonio	82	28°11'25"	96°46'45"	1 mile E of Ayres Point
San Antonio	San Antonio	83	28°11'25"	96°44'00"	2 miles S of Panther Point Lake mouth

Table 1. (Cont'd)

Bay system	Station number	Latitude	Longitude	Station identification
Bay	Station number	Latitude	Longitude	
Aransas	1	28°01'50"	97°02'00"	Off of bulkhead at NE end of Rockport beach
Aransas	2	28°07'28"	96°59'00"	Off S side of Goose Island near restrooms
Aransas	3	27°59'05"	97°04'00"	Halfway between Turtle Bayou and ICWW Marker 7
Aransas	4	27°57'15"	97°04'15"	Just N of oil channel halfway between Big Bayou and Trout Bayou
Redfish	5	27°56'00"	97°05'15"	Off second island NW of Big Bayou in Redfish Bay
Copano	6	28°03'22"	97°08'10"	Off SW tip of Rattlesnake Point
Aransas	7	27°55'13"	97°04'22"	Just N of mouth of Corpus Christi Bayou
Aransas	8	27°53'40"	97°02'42"	Off NE tip of Lydia Ann Island
Aransas	9	27°55'17"	97°01'03"	1.0 mile SW of tanks on San Jose Island behind Mud Island
Aransas	10	27°55'43"	97°02'38"	On SW tip of Mud Island
Aransas	11	27°56'42"	97°01'28"	Middle of Mud Island N side
Aransas	12	27°56'18"	97°01'22"	Middle of Mud Island S side
Aransas	13	27°57'05"	96°59'35"	On NE tip of Mud Island
Aransas	14	27°58'06"	96°58'27"	1.0 mile N of San Jose Ranch house
Aransas	15	27°59'00"	96°58'07"	2.0 miles N of San Jose Ranch house within Allyn's Bight
Aransas	16	28°07'37"	96°55'42"	On Blackjack Peninsula at Dunham Point
Aransas	17	28°01'14"	96°58'00"	On San Jose Island, 1.5 miles NE of Allyn's Lake
Aransas	18	28°01'55"	97°01'29"	Off SE tip of Key Allegro Isle
Aransas	19	28°04'00"	96°57'40"	Off Deadman Island NW of Long Reef
Aransas	20	28°03'12"	96°56'44"	On Big Island at SE end of Long Reef
Aransas	21	28°04'18"	96°55'55"	Midway between Long Reef and Jay Bird Reef

Table 1. (Cont'd)

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Aransas	Aransas	22	28°05'10"	96°55'33"	On San Jose Island near Jay Bird Reef marker
Aransas	Aransas	23	28°06'03"	96°54'22"	S of Spalding Reef near TPWD post marker
Aransas	Aransas	24	28°06'40"	96°53'25"	SE end of Shell Reef at mouth of Spalding Bight
Aransas	Aransas	25	28°06'48"	96°55'26"	On SE side of SW tip of Dunham Island
Dunham	Dunham	26	28°07'57"	96°55'05"	On Grass Island at mouth of Dunham Bay
Dunham Aransas	Dunham Aransas	27	28°08'53"	96°54'22"	In NE most end of Dunham Bay
Dunham Aransas	Dunham Aransas	28	28°59'52"	96°58'47"	At the break between Allyn's Lake and the bay 200 yds N of duck blind
Aransas	Aransas	29	28°07'20"	96°56'45"	Midway between Dunham and Blackjack Point
Aransas	Aransas	30	28°00'00"	97°03'31"	Just S of Perry Bass docking facilities
Aransas	Aransas	31	28°06'15"	97°01'07"	On NE tip of Live Oak Point near reef marker
Aransas	Aransas	32	28°05'21"	97°02'00"	Off Fulton beach about 1.0 mile S of Racquet Club in front of Dr. Foster's residence
Aransas	Aransas	33	28°04'16"	97°02'07"	Along bulkhead shoreline just S of Sandollar Motel
Aransas	Aransas	34	28°04'38"	96°57'53"	On island at end of Halfmoon Reef near ICWN Marker 22
Carlos Copano	Carlos Copano	35	28°07'05"	96°53'07"	In SE corner of Carlos Bay
Mesquite	Mesquite	36	28°05'05"	97°04'34"	Approximately 1.0 mile SW of airport
Mesquite	Mesquite	37	28°07'09"	96°51'08"	1.5 miles W of mouth of Cedar Bayou
Mesquite	Mesquite	38	28°06'58"	96°49'55"	At mouth of Cedar Bayou, W side
Mesquite	Mesquite	39	28°07'18"	96°48'50"	In SE Mesquite Bay about 1.0 mile NE of mouth of Cedar bayou

Table 1. (Cont'd)

Bay System	Bay	Station number	Latitude	Longitude	Station identification
Aransas	Mesquite	40	28°08'21"	96°48'07"	At end of Bray Cove
	Mesquite	41	28°08'55"	96°49'04"	Matagorda Island, 1.5 miles S of Ayres Dugout
	Mesquite	42	28°10'01"	96°49'55"	At Ayres Dugout on the Mesquite Bay side
	Mesquite	43	28°10'23"	96°51'07"	Off Roddy Island in N part of Mesquite Bay
	Mesquite	44	28°09'55"	96°52'32"	1.0 mile SW of Sundown-Mesquite Bay Pass
Carlos	45	28°08'52"	96°53'08"	S side of Cedar Point	
Carlos	46	28°07'50"	96°54'15"	On NE side of Cape Carlos by first refuge marker	
St. Charles	47	28°08'03"	96°57'38"	Off Bird Point inside St. Charles Bay	
St. Charles	48	28°09'57"	96°56'53"	Just S of Egg Point near clump of trees and refuge marker	
St. Charles	49	28°10'35"	96°56'18"	Point of land just N of Bill Mott Bayou	
St. Charles	50	28°12'05"	96°55'43"	Between Little Devil Bayou and Big Devil Bayou	
St. Charles	51	28°13'00"	96°56'33"	At Meile Dietrich Point	
St. Charles	52	28°14'32"	96°55'34"	Just N of McHugh Bayou	
St. Charles	53	28°16'10"	96°54'55"	At mouth of Twin Creek	
St. Charles	54	28°15'00"	96°56'30"	At mouth of Salt Creek outside cove	
St. Charles	55	28°13'41"	96°57'26"	1.5 miles SW of mouth of Salt Creek	
St. Charles	56	28°13'04"	96°58'47"	Inside Cavasso Creek close to Highway 35	
St. Charles	57	28°11'55"	96°56'50"	0.5 mile NW of Big Sharps Point	
St. Charles	58	28°10'53"	96°57'16"	0.5 mile SW of Little Sharps Point	
St. Charles	59	28°10'00"	96°58'00"	On S side of Cow Chip Slough	

Table 1. (Cont'd)

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Aransas	St. Charles	60	28°08'53"	96°58'20"	Just N of the Big Tree
	St. Charles	61	28°07'57"	96°58'28"	On SE tip of Hail Point
	Copano	62	28°08'10"	97°00'37"	On Lamar Peninsula on W side
Copano	Copano	63	28°09'01"	97°01'42"	at N end of Copano Causeway
	Copano	64	28°09'43"	97°01'08"	On W tip of Newcomb Point
Copano	Copano	65	28°11'00"	97°01'05"	Just S of Holiday Beach channel; Palmetto Point
	Copano	66	28°11'52"	97°00'42"	At W end of Shell Point near duck blind
Copano	Copano	67	28°12'07"	97°02'07"	On a point of land 1.0 mile E of Turtle Pen Point
	Copano	68	28°11'54"	97°01'14"	On N side of the mouth of Copano Creek
Copano	Copano	69	28°11'18"	97°02'21"	On S side of Turtle Pen Point
	Copano	70	28°10'41"	97°04'00"	1.5 miles SW of Turtle Pen Point
	Copano	71	28°10'00"	97°05'27"	About 3.0 miles SW of Turtle Pen Point
Copano	Copano Mission	72	28°08'57"	97°07'22"	About 4.5 miles SW of Turtle Pen Point
	Copano	73	28°10'00"	97°08'27"	Just to the NW of Copano Reef
Copano	Copano	74	28°07'57"	97°09'27"	About 1.5 miles N of mouth of Mission Bay
	Copano	75	28°06'41"	97°11'15"	Between the mouth of Mission Bay and Shellbank Reef
	Copano	76	28°05'32"	97°13'28"	Approximately 1.5 miles NE of Bayside
Copano	Copano	77	28°03'45"	97°13'22"	0.2 mile W of bridge at Black Point
	Copano	78	28°04'18"	97°12'39"	On S side of the mouth of the Aransas River
Copano	Copano	79	28°03'39"	97°11'05"	0.5 mile E of the S end of Bayside bridge on Egery Island
	Copano				2.0 miles SE of the S end of Bayside Bridge; Rincon de la Cera

Table 1. (Cont'd)

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Aransas	Copano	80	28°03'09"	97°09'07"	On N side at the E most island forming Swan Lake
	Port	81	28°01'57"	97°08'53"	On NW end of the old bridge ruins across Port Bay
	Port	82	28°01'15"	97°09'14"	1.0 mile SW of Port Bay Bait Stand, on E tip of land forming horseshoe
	Port	83	28°00'17"	97°09'23"	On point of land 0.8 mile NE of Highway 881 bridge on W side of bay
	Port	84	27°59'29"	97°10'15"	On E shore just S of Highway 881 bridge
	Port	85	27°58'53"	97°10'40"	On W shore 1.0 mile SW of Highway 881 bridge
	Port	86	27°59'54"	97°08'56"	0.8 mile due S of Port Bay ranch house, near slough
	Port	87	28°01'05"	97°08'31"	0.5 mile S of E side of old bridge ruins
	Port	88	28°01'45"	97°07'47"	0.5 mile E of Port Bay Bait Stand
	Port	89	28°02'19"	97°07'48"	At point of land forming NW boundary of Italian Bend Hannibal Point
Copano	Copano	90	28°04'38"	97°06'03"	The third T-head NE of Copano Village; close to airport
	Copano	91	28°05'50"	97°03'04"	On W tip of Redfish Point near old barge
	Copano	92	28°07'03"	97°03'12"	In Mesquite Bay 2.5 miles NW from mouth of Cedar Bayou
Mesquite		93	28°08'13"	96°53'21"	On S side of NE tip of Hog Island 0.5 mile SW of Pauls Mott reef marker

					ICWW Marker 79, spoil dump

Appendix C Trammel Net Station Locations

Table 1 . Trammel net station locations in each bay system, October 1980-September 1981.

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Galveston	Galveston	101	29°32'05"	95°00'30"	0.9 mile S of entrance of Clear Lake Channel
	Galveston	102	29°31'00"	94°59'20"	0.6 mile W of surfaced ramp at Bacliff
	Galveston	103	29°30'20"	94°57'05"	0.2 mile E of Houston Lighting and Power Company's P. H. Robinson Generating Station's discharge canal
East Dickinson		104	29°32'45"	94°29'50"	1.5 mile E of Frozen Point
		105	29°28'00"	94°57'50"	Dickinson Bayou, 0.5 mile N of bridge Hiway 146
		106	29°27'40"	94°56'30"	0.2 mile W of Marker 21 in Dickinson Bayou
Trinity Moses Lake		107	29°38'45"	94°42'00"	0.3 mile S of Double Bayou
	Moses Lake	108	29°25'40"	94°57'05"	Mouth of Moses Bayou, NE side
	Moses Lake	109	29°25'20"	94°56'40"	0.8 mile E of mouth of bayou
	Galveston	110	29°26'30"	95°54'10"	0.9 mile E of entrance to Moses Lake
Galveston Jones Lake		111	29°24'10"	94°53'10"	0.5 mile N of Texas City Dike
	Jones Lake	112	29°18'40"	94°56'30"	Highland Bayou
	Galveston	113	29°20'40"	94°53'35"	0.6 mile N of Campbell Bayou
	Galveston	114	29°20'00"	94°53'50"	0.1 mile SE of mouth of Campbell Bayou
Galveston Galveston		115	29°21'05"	94°49'35"	North tip of Pelican Island
	Galveston	116	29°20'35"	94°49'20"	On Pelican Island, 0.2 mile S of ICWW
Galveston		117	29°19'45"	94°49'25"	Middle of W side of Pelican Island
Galveston		118	29°17'25"	94°52'05"	0.2 mile E of SE end of railroad bridge
Jones Lake Jones Lake		119	29°18'35"	94°54'45"	E corner of Jones Lake
	Jones Lake	120	29°18'45"	94°55'45"	Highland Bayou, W end of Jones Lake

Table 1 . (Cont'd).

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Galveston	Jones Lake	122	29°17'50"	94°56'50"	Basford Bayou
West		123	29°16'35"	94°58'30"	0.9 mile NE of Greens Cut
Greens Lake		124	29°15'50"	94°59'55"	S shore of Greens Lake
Greens Lake		125	29°16'35"	94°59'30"	N shore of Greens Lake
West		126	29°14'15"	95°00'55"	0.2 mile SW of Carancahua Cut
Carancahua Lake		127	29°14'20"	95°01'30"	S shore of Carancahua Lake
West		128	29°13'00"	95°01'45"	Carancahua Point, 1.5 mile SW of Carancahua Cut
Halls Lake		129	29°11'15"	95°05'45"	E shore of Halls Lake
Halls Lake		130	29°10'45"	95°06'20"	0.2 mile S of The Narrows
Chocolate		131	29°11'10"	95°06'30"	0.2 mile NW of The Narrows

	Lower Laguna Madre	170	26°04'10"	97°09'50"	0.25 mile E of South Padre Island Coast Guard Station

Appendix D Bag Seine Station Locations

Table 1 . Bag seine station locations in each bay system, October 1980-September 1981.

Bay system	Bay	Station number	Latitude	Longitude	Station identification
Galveston	Galveston	201	29°30'20"	94°57'05"	0.2 mile E of Houston Lighting and Power Company's P. H. Robinson Generating Station's discharge canal
Dickinson		202	29°28'40"	94°55'40"	0.4 mile N of April Fool Point
Dickinson		203	29°28'20"	94°57'10"	Inside Dickinson Bay
Dickinson		204	29°27'40"	94°56'30"	0.3 mile W of Marker 21 in Dickinson Bay Channel
Moses Lake		205	29°26'05"	94°56'05"	1.2 mile SW of tide gate on entrance of Moses Lake
Moses Lake		206	29°25'40"	94°57'05"	NE side of mouth of Moses Bayou
Moses Lake		207	29°25'20"	94°56'20"	S shore of Moses Lake, 0.8 mile E of mouth
West Galveston		208	29°16'05"	94°59'10"	0.1 mile NE of Greens Cut

	Lower Laguna Madre	289	26°15'35"	97°17'35"	East end of El Realito Peninsula
	Lower Laguna Madre	290	26°19'55"	97°20'02"	South end of Horse Island
	Lower Laguna Madre	291	26°08'20"	97°17'30"	North end of Holly Beach

Appendix E. Hydrological Data Summary

Table 1. Monthly mean^a surface salinity (o/oo) at sampled gill net, trammel net and bag seine stations in each Texas bay system during October 1980-September 1981 (Blank = no measurement taken).

Month and year		East Galveston	Matagorda ^b	Matagorda	San Antonio	Aransas	Corpus Christi	Upper Laguna Madre	Lower Laguna Madre
Oct. 1980		22.6	26.5	27.7	20.1	19.6	27.6	23.9	31.8
Nov. 1980		22.5	24.1	23.4	18.8	21.1	29.8	25.2	32.7
Dec. 1980		23.6	26.4	24.8	18.2	20.9	28.8	25.0	28.3
Jan. 1981		21.7	27.1	31.4	31.6	19.7	30.4	29.3	26.9
Feb. 1981		22.2	28.5	26.2	20.2	19.1	27.4	27.1	28.9
Mar. 1981		24.1	30.0	29.8	24.4	20.2	31.2	28.6	24.6
Apr. 1981		29.0	30.5	27.7	21.6	22.5	32.2	30.8	30.8
May 1981		25.6	29.2	14.8	20.3	14.4	28.0	28.9	30.4
June 1981		5.2		9.0	7.6	6.5	22.2	24.0	30.0
July 1981		19.8		9.3	7.2	5.0	19.7	24.4	19.5
Aug. 1981		7.7		20.7	9.0	9.7	25.0	22.1	37.0
Sept. 1981		9.3		15.4	5.9	5.8	24.0	24.4	30.9

^a Data collected at both the time of gill net set and retrieval are included.

^b Only gill net stations were sampled.

Table 2. Monthly mean^a surface water temperature (C) at sampled gill net, trammel net and bag seine stations in each Texas bay system during October 1980-September 1981. (Blank = no measurement taken).

Month and year	East Galveston	Matagorda ^b	Matagorda	San Antonio	Aransas	Corpus Christi	Upper Laguna Madre	Lower Laguna Madre
Oct. 1980	22.9	28.9	25.6	21.5	21.4	22.8	24.1	19.9
Nov. 1980	17.1	22.0	16.9	20.2	17.4	17.9	18.0	18.5
Dec. 1980	16.2	17.4	16.2	17.1	17.1	17.7	17.6	17.4
Jan. 1981	13.6	11.9	13.5	21.1	13.3	12.4	15.1	17.0

^a Data collected at both the time of gill net set and retrieval are included.

^b Only gill net stations were sampled.

Table 3. Monthly mean^a surface turbidity^b (JTU) at sampled gill net, trammel net and bag seine stations in each Texas bay system during October 1980-September 1981. (Blank = no measurement taken).

Month and year		East Galveston	Matagorda ^c	Matagorda	San Antonio	Aransas	Corpus Christi	Upper Laguna Madre	Lower Laguna Madre
Oct. 1980	55	61	43	24	41	28	82	164

Sept. 1981	57		50	33	47	48	52	66	

a Data collected at both the time of gill net set and retrieval are included.

b Any measurement < 25 JTU was assigned a value of 24 JTU.

c Only gill net stations were sampled.

Table 4. Monthly mean^a surface dissolved oxygen (ppm) at sampled gill net, trammel net and bag seine stations in each Texas bay system during October 1980-September 1981. (Blank = no measurement taken).
