Abstract.—To obtain information necessary for effective management of the sport-boat fishery in Texas marine waters, the Texas Parks and Wildlife Department has conducted on-site, trip-ending interviews of anglers at coastal boat-access sites since 1974. Initial survey efforts targeted private-boat trips (non-guided) from inshore waters (bays and passes). Party-boat trips (guided) and trips from offshore waters (Gulf of Mexico) were added to the survey by 1983. Gulf waters included the Texas Territorial Sea (TTS; surf line to 16.7 km offshore) and the United States Exclusive Economic Zone (EEZ; beyond 16.7 km offshore). Annual (15 May of one year to 14 May of the next year) estimates generated from interview data were used to monitor trends in fishing pressure, landings, and catch rates. Trends in mean fish length, mean fish weight, mean party size, mean trip length, angler residential origin, species sought, and trip satisfaction also were monitored. During the last 10 survey years (1998-99 through 2007-08), private-boat fishing in bays and passes was the predominant sport-boat fishing activity with 79% of the fishing pressure (about 5.29 million man-h per year) and 72% of the landings (about 1.54 million fish per year). Spotted seatrout (*Cynoscion nebulosus*, 42%), red drum (*Sciaenops ocellatus*, 13%), sand seatrout (*Cynoscion arenarius*, 10%), and Atlantic croaker (*Micropogonias undulatus*, 9%) were the most often landed species from bays and passes by private-boat anglers. Party-boat fishing in bays and passes accounted for 13% of the fishing pressure (about 0.88 million man-h per year) and 21% of the landings (about 0.44 million fish per year) with spotted seatrout (73%) and red drum (16%) being the predominant species. The remaining 8% of fishing pressure (about 0.54 million man-h per year) and 7% of landings (about 0.16 million fish per year) were attributed to private-boat and party-boat fishing in the TTS and EEZ. Spotted seatrout and red snapper (*Lutjanus campechanus*) were the most often landed species from the TTS. Red snapper and king mackerel (*Scomberomorus cavalla*) predominated in the EEZ.

Introduction

Marine sport-boat fishing is an economically and biologically important fishery along the Texas coast. Accurate information collected on an on-going basis is needed to effectively manage this popular fishery.

The first attempt to determine the amount of fish taken annually by sport anglers in Texas coastal waters using personal interviews was conducted in 1957-58 (Beldon Associates 1958). Systematic interviews of a statewide sample of 2,000 households were used to estimate the harvest of spotted seatrout (*Cynoscion nebulosus*), red drum (*Sciaenops ocellatus*), black drum (*Pogonias cromis*), and flounder (*Paralichthys sp.*). The study was repeated in 1959-60 for comparison with previous findings (Beldon Associates 1960).

On-site trip-ending interviews of sport-boat anglers were attempted by Simmons (1961) at one site in upper Laguna Madre bay system during August 1959 through July 1960, by Stevens (1963) at one site in San Antonio Bay system during June 1962 through August 1962, and by More (1965) at three sites in Galveston Bay system during June 1963 through June 1964. Each attempt encountered a variety of problems including difficulty estimating overall fishing effort and landings from collected data.

More detailed methods were used by Bowman et al. (1976) in an attempt to estimate total fish yield from the Corpus Christi Bay area. On-site trip-ending interviews of sport anglers were conducted at multiple boat-access and shore-based sites during June through August 1974.

Based in part on these early attempts, Heffernan et al. (1976) and Breuer et al. (1977) initiated the survey that is the subject of this report. On-site trip-ending interviews of sport-boat anglers were conducted at multiple boat-ramp sites in the Galveston, San Antonio, Aransas, and upper Laguna Madre bay systems during September 1974 through August 1975; and in the Sabine Lake, Matagorda, Corpus Christi, and lower Laguna Madre bay systems during September 1975 through August 1976 (Heffernan and Green 1977).

Several aspects of the survey were modified during the next eight years to enhance survey efficiency and to increase accuracy and precision of collected data (Green et al. 1978; McEachron 1980a, 1980b; McEachron and Green 1982, 1983, 1984; Osburn and Ferguson 1985, 1986). Osburn and Osborn (1991) described these modifications and explained efforts to ensure comparability of data collected during these years. The survey proceeded with few changes during subsequent years (Osburn and Ferguson 1987; Osburn et al. 1988; Maddux et al. 1989; Green et al. 1991a, 1991b; Campbell et al. 1991; Weixelman et al. 1992; Warren et al. 1994; Green et al. 2002; Green and Campbell 2005).

The primary objectives of this study were to estimate daytime annual fishing pressure (effort in man-hours), landings (number of fish harvested), catch rates (harvest per unit effort as an indicator of resource availability or fishing success), species compositions, and size compositions (mean lengths and mean weights of fish harvested) for sport-boat anglers on trips lasting 12 h or less in Texas marine waters. The secondary objectives were to summarize the residential origin, species sought, and trip satisfaction of these sport-boat anglers and to assemble supporting information to aid in interpretation of study results. The tertiary objectives were to estimate daytime annual fishing pressure, landings, and catch rates for bay and pass private-boat anglers on trips lasting more than 12 h, and to summarize the residential origin of these anglers.

Methods

Procedures used to collect data summarized in this report changed over time. A developmental process occurred in which changes and refinements were incorporated to improve the survey. Major changes to the survey on 15 May 1983 remained in effect through 14 May 2008. Refinements were added to the survey on 15 May 1992, and procedures detailed in this report apply to this date and beyond.

The primary focus of the Texas Marine Sport-Harvest Monitoring Program was private-boat bay and pass fishing. Private-boat gulf fishing, party-boat bay and pass fishing, and party-boat gulf fishing also were surveyed.

Survey Attributes

Target population.—The target population for the survey consisted of sport-boat angling parties with trip lengths of 12 h or less that ended their fishing trips from 1000 to 1800 hours at

inventoried boat-access sites. These angling parties were divided into two groups: private-boat parties (i.e., those using privately-owned and rental boats, as well as those fishing in tournaments) and party-boat parties (i.e., those using a professional fishing guide and had ten or fewer people).

Spatial dimensions.—Texas marine waters were divided into two primary areas for the survey: bay and pass (i.e., marine waters shoreward of barrier islands, including the openings or passes that connect bays with the Gulf of Mexico) and gulf (i.e., Gulf of Mexico waters). Pass areas were defined as extending 1.9 km gulfward from the gulfward end of the pass.

Bay and pass areas were divided geographically into eight bay systems: Sabine Lake, Galveston Bay, Matagorda Bay (including East Matagorda Bay), San Antonio Bay, Aransas Bay, Corpus Christi Bay, upper Laguna Madre, and lower Laguna Madre (Figure 1). Except for 1975-76, Sabine Lake was not included in the survey until 15 May 1987.

Gulf areas were divided into five geographic areas based on proximity of access. These included gulf waters off Sabine Lake; Galveston Bay; Matagorda and San Antonio Bays; Aransas and Corpus Christi Bays, and upper Laguna Madre; and lower Laguna Madre. Each of these areas was further divided into two areas based on governmental jurisdiction: Texas Territorial Sea (TTS) (i.e., Gulf of Mexico waters from the surf line to 16.7 km offshore, excluding the 1.9-km area around the gulfward end of passes) and United States Exclusive Economic Zone (EEZ) (i.e., Gulf of Mexico waters off Texas beyond 16.7 km offshore).

Temporal dimensions.—Surveys were conducted year-round. A survey year extended from 15 May of one year to 14 May of the next year. Each survey year was divided into a high-use season and a low-use season based on distribution of fishing effort. The high-use season extended from 15 May to 20 November of one year. The low-use season extended from 21 November of one year to 14 May of the next year. Each season was further divided into weekend days (Saturday and Sunday) and weekdays (Monday through Friday).

Number of surveys.—Since 15 May 1983, 1,014 routine surveys were scheduled annually to estimate bay and pass fishing pressure and landings. In high-use season, 26 weekend and 46 weekday surveys were scheduled for Sabine Lake and San Antonio bay systems, and 31 weekend and 66 weekday surveys were scheduled for the other six bay systems. In low-use season, 12 weekend and 24 weekday surveys were scheduled for all bay systems.

About 36 “gulf-only” surveys were scheduled each high-use season to supplement routine surveys for estimation of gulf fishing pressure and landings. These surveys were initiated on 15 May 1992, and their distribution was variable between weekend days and weekdays. During gulf-only surveys, only sport-boat gulf fishing parties were interviewed in full; other boating parties were given abbreviated interviews. Gulf-only surveys were conducted only at sites known to have sport-boat gulf fishing activity.

Target species.—All landed species were enumerated during surveys. Target species for estimation of landings and catch rates were selected for their historical, current, or anticipated importance, and differed between bay and pass, and gulf areas.

Bay and pass estimates were determined for ten species or species groups: Atlantic croaker (*Micropogonias undulatus*), black drum, gafftopsail catfish (*Bagre marinus*), red drum, sand seatrout (*Cynoscion arenarius*), sheepshead (*Archosargus probatocephalus*), southern flounder (*Paralichthys lethostigma*), spotted seatrout, “other” species (all remaining species), and all species combined.

Gulf estimates were determined for twenty species or species groups: Atlantic croaker, Atlantic sharpnose shark (*Rhizoprionodon terraenovae*), Atlantic spadefish (*Chaetodipterus faber*), black drum, blacktip shark (*Carcharhinus limbatus*), cobia (*Rachycentron canadum*), dolphinfish (*Coryphaena hippurus*), gray triggerfish (*Balistes caprisucus*), greater amberjack (*Seriola dumerili*), king mackerel (*Scomberomorus cavalla*), lane snapper (*Lutjanus synagris*), little tunny (*Euthynnus alletteratus*), red drum, red snapper (*Lutjanus campechanus*), sand seatrout, Spanish mackerel (*Scomberomorus maculatus*), spotted seatrout, vermilion snapper (*Rhomboplites aurorubens*), “other” species (all remaining species), and all species combined.

Survey Site Inventory

The sampling frame consisted of inventoried boat-access sites. Sites were uniquely numbered in each bay system, and included boat ramps and wet-slip sites accessible to the general public and survey personnel. Boating facilities at private residences were not included.

The site inventory was updated biannually to reflect opening of new sites, closing of old sites, and reopening of closed sites. The numbering system for sites was revised effective 15 May 1983 when wet-slip sites (Spiller 1987) were added and site numbers were reassigned. There were 276 active sites in the 2007 high-use season and 274 active sites in the 2007-08 low-use season (Appendix A.1). Of these, 41 were considered active gulf sites in the 2007 high-use season and 17 in the 2007-08 low-use season.

Survey Site Roving Counts

Roving counts of inventoried boat-access sites were conducted to determine the number of boating parties using each site. Since 15 May 1983, 128 roving counts were conducted annually.

Roving counts were conducted in each bay system by driving from site to site and counting empty boat trailers and empty wet slips. Wet-slip counts were adjusted based on number of non-rented slips at or near time of rove. These counts occurred during a 4.5-h period from 0800 to 1230 hours on weekends and weekdays during high-use and low-use seasons.

Roving counts were conducted on “good-weather” days to maximize counts and to obtain a better definition of differences among sites. In high-use season, a good-weather day was when Small Craft Advisories were not in effect. In low-use season, a good-weather day was determined based on a nomograph (Spiller et al. 1988) consisting of air temperature, wind speed, and precipitation measured at 0800 hours on day of rove.

Ten roving counts were done in each bay system during high-use season. One weekend rove and one weekday rove were conducted during each of the following five periods: 15 May-30 June, 1-31 July, 1-31 August, 1-30 September, and 1 October-20 November. For weekend roves, two must have been conducted on Saturdays and two must have been conducted on Sundays.

Six roving counts were done in each bay system during low-use season. One weekend rove and one weekday rove were conducted during each of the following three periods: 21 November-31 January, 1 February-31 March, and 1 April-14 May. For weekend roves, one must have been conducted on Saturday and one must have been conducted on Sunday.

Survey Site Relative Fishing Pressures

Bays and passes.—Prior to each season, two relative fishing pressure files were created for each bay system, one for weekends and one for weekdays. This resulted in 32 bay and pass pressure files coastwide each year. Pressure files were used in the selection of boat-access sites to be surveyed.

For each season, roving counts for each site from the previous three years were averaged for each day type; counts from the most recent year were weighted 50% and counts from the other two years were weighted 25% each. For each day type, the average count at a given site was adjusted for target-area, bay and pass, private-boat fishing activity and for boat-trailer parking location based on survey data collected at that site during the previous three years. For sites in each bay system with less than ten interviews during the previous three years, a single generic adjustment was created for each day type by pooling the survey data from all such sites in the bay system. Adjustment for boat-trailer parking location accounted for trip-ending parties at each site that would not have had an empty boat trailer or empty wet slip available for counting during a rove.

For each day type in each season, the adjusted average count for each site was divided by the sum of the adjusted average counts from all sites in that bay system to produce a relative fishing pressure value for each site. This value represented the proportion of the total bay system fishing pressure occurring at that site.

Gulf areas.—Prior to each high-use season, weekend and weekday gulf pressure files were created for each of the five gulf areas. Ten separate pressure files were produced. These were used in the selection of boat-access sites for supplemental gulf-only surveys.

Roving counts were averaged and adjusted in the same manner as described for bays and passes with the following exceptions. TTS and EEZ interview data from routine and gulf-only surveys were pooled to adjust roving counts for each of the five gulf areas. Since there were much fewer gulf than bay and pass interviews, more than three previous years of interview data were used to adjust roving counts for target-area gulf fishing (six previous years for the gulf off Galveston Bay and four previous years for the gulf off the other four areas). Many of the inventoried boat-access sites had little or no gulf fishing activity. These sites were eliminated from the gulf pressure files based on four threshold values applied to adjusted rove counts. If the

adjusted rove count fell below 1.0 on high-use weekends, 0.3 on high-use weekdays, 0.2 on low-use weekends, or 0.1 on low-use weekdays, then the site was dropped from the gulf pressure file for that season and day-type combination. Adjusted rove counts from dropped sites were pooled and retained for each pressure file.

Survey Site Selection and Survey Scheduling

Prior to each season a sampling schedule was generated for each day type in each bay system based on the relative fishing pressure files. The selection process was divided into 30-day intervals to ensure even distribution of surveys throughout the season.

Proportional random sampling (with replacement) was used to select survey sites for each bay system. Sites were selected in proportion to their relative fishing pressure values and thus had an unequal chance of being selected (e.g., a site with 5% of a bay system's fishing pressure would receive about 5% of the scheduled surveys). To reduce the number of survey days with no interviews conducted, a site was not included for selection if its adjusted rove count was below 3.0 on weekends or 1.0 on weekdays (no rounding up), or if its ideal number of surveys (product of total number surveys to be conducted by day type and relative pressure of site by day type) did not round up to or exceed one survey. The most inclusive of the two thresholds was applied.

Semi-random sampling (without replacement) was used to select a set number of weekend and weekday survey dates for each 30-day interval. An effort was made to balance the number of surveys among days of the week within each day type. These measures allowed sampling effort to be evenly distributed across seasons and day types. Weekly workload constraints also were considered.

To reduce the number of surveys conducted at "crossover" sites, the bay and pass schedule was adjusted to maximize the number of "double" surveys conducted at these sites. A site located in one bay system was designated as a crossover site for an adjacent bay system if adjacent-bay-system fishing activity originating from that site represented at least 1% of the adjacent bay system's fishing activity. Crossover sites occurred in boundary areas between Matagorda and San Antonio Bay systems; San Antonio and Aransas Bay systems; Aransas and Corpus Christi Bay systems; and Corpus Christi and upper Laguna Madre bay systems (Appendix A.1). When a double survey was conducted, the survey counted as a survey for both bay systems. Double surveys reduced manpower needs and the likelihood of over-burdening anglers at crossover sites. From May 1983 to May 1992, the list of crossover sites was not modified. Beginning in May 1992 the list of crossover sites was evaluated annually based on the 1% criterion described above.

An effort was made to evenly distribute frequently surveyed sites across each season for each day type. This was important because fishing pressure and landings were distributed unevenly across seasons.

After the high-use season bay and pass schedule was drawn and examined for representation by sites included in the gulf pressure files, gulf-only surveys were added to the

survey schedule in proportion to the gulf pressure file. Gulf-only surveys were not conducted in low-use season due to the relatively small amount of gulf fishing pressure at that time of the year.

Survey Procedures

Overview.—The purpose of conducting surveys was threefold. First, they were used to collect fishing effort (man-hours based on trip length and number of anglers in party) and harvest (does not include fish caught and released) data for estimation of fishing pressure, landings, and catch rates. Second, they were used to collect data on boating-activity type, boating-activity location, and boat-trailer location for adjustment of roving counts. Third, they were used to collect other data for other purposes (e.g., gear used, bait used, angler residential origin, species sought, and trip satisfaction). Weixelman and Chai (1991) and Morris et al. (1999) examined bait-use data. Green et al. (1991a, 1991b, 1991c) summarized species sought and trip satisfaction data.

When a site was surveyed, all trip-ending boat parties intercepted between 1000 and 1800 hours were interviewed. Relatively few interviews were “missed” because multiple personnel were assigned to busy sites. Based on examination of previously collected data (Spiller et al. 1988), surveys were cancelled in the low-use season on “bad-weather” days. A bad-weather day was determined based on a nomograph consisting of air temperature, wind speed, and precipitation observed at 0900 hours. Also based on examination of previously collected data (Weixelman and Green 1984, Osburn and Weixelman 1989), surveys were terminated early if no angling activity interviews were conducted by pre-determined times: 1300 hours on high-use season weekends; 1400 hours on high-use season weekdays and low-use season weekends; and 1600 hours on low-use season weekdays.

The primary equipment used for conducting surveys included a 1-meter measuring board, a fish identification book (primarily Hoese and Moore 1977, 1998), and standard data sheets. Except for reducing the number of lines per page from fifteen to ten on 1 July 1995, the same data-sheet format has been used since 15 May 1983.

Routine surveys.—Data elements collected from angling parties included boat identification number; time when interview was conducted; trip length to nearest 0.5 h (not fishing time); type of fishing activity (private-boat or party-boat); number of anglers and residential origin of each (non-fishing party members not included); location where most of the harvested fish were caught or location where most fishing effort occurred if no fish were harvested; gear and bait used to catch harvested fish or gear and bait used most if no fish were harvested; location where trailer was parked during trip (or if wet-slip used, then whether wet-slip was rented for the boat); trip satisfaction level and species sought for one randomly selected party member; number of each species landed (if any); and total lengths to nearest millimeter for up to six randomly selected specimens of each species landed (if any).

Data elements collected from non-angling parties included boat identification number; time when interview was conducted; trip length to nearest 0.5 h; type of boating activity; number of people and residential origin of each; location where most of the boating activity occurred;

and location where trailer was parked during trip (or if wet-slip used, then whether wet-slip was rented for the boat).

Gulf-only surveys.—Data elements collected from gulf angling parties during gulf-only surveys were the same as those collected during routine surveys.

Data elements collected from other boating parties were limited to boat identification number; time when interview was conducted; type of boating activity; location where most of the boating activity occurred; and location where trailer was parked during trip (or if wet-slip used, then whether wet-slip was rented for the boat).

Survey Operations Manual and Quality Control

Survey and roving-count procedures were contained in a detailed operations manual (Texas Marine Sport-Harvest Monitoring Program Operations Manual) that was updated annually. The manual also included data encoding lists, weekend and weekday nomographs for low-use season, and a history of procedure changes.

A quality control program for surveys and roving counts was initiated in October 1986 to monitor compliance with established procedures. The program included assigned observers who periodically visited personnel conducting surveys and roving counts. Refinements to the program were made in May 1990 and January 1994. Since January 1994, quality control visits were conducted monthly for surveys and annually for roving counts in each bay system using detailed report forms.

Data Processing

Survey and roving count data sheets were edited and submitted for computer keying. Data were keyed into a temporary database and subjected to computer programmed error checks. Keyed data were printed with potential errors flagged for manual line-by-line edit against original data sheets. Needed corrections were made and data were transferred to a permanent database for later access as needed.

Calculation of Fishing Pressure and Harvest Estimates

Methods used to calculate fishing pressure (effort) and harvest estimates from data collected prior to 15 May 1992 were described by Osburn and Osborn (1991) and Warren et al. (1994). These methods were followed in this study with several exceptions.

In the early 1990's, computer programming for creation of relative fishing pressure files and for calculation of estimates was converted from PL1 to SAS[®] (SAS Institute Inc., Cary, North Carolina). During this conversion several changes were made. The most important change eliminated the use of non-target-area fishing activity in determination of relative pressure values and in summary of daily fishing effort and landings for each site. This change, applied to data collected after 14 May 1992, increased the accuracy of pressure files and estimates for each bay system, but jeopardized strict comparison with previously calculated estimates. To achieve

comparability, pressure files and estimates were recalculated for the 1983-84 through 1991-92 survey years. Recalculation was preceded by an extensive effort to detect and correct miscoded data in the database. Because of inconsistencies in sampling procedures prior to 15 May 1983, pressure files and estimates were not recalculated for the 1974-76 through 1982-83 survey years.

Another change involved pressure file application. Previous methodology used the same pressure file to select survey sites during schedule preparation and to expand observed fishing effort and landings during estimate calculation. Updated methodology used a preliminary pressure file for site selection (as previously described) and a final pressure file for expansion. The final pressure file incorporated target-period roving count and survey data to make it more reflective of target-period conditions. Roving counts from the target-period and the previous two years were averaged for each day type; counts from the target-period were weighted 50% and counts from the other two years were weighted 25% each. For bays and passes, survey data from the target-period and the previous two years were used to adjust the average rove counts. For the gulf, survey data from the target-period and the previous three (gulf off all areas except Galveston) or five (gulf off Galveston) years were used to adjust the average rove counts. These changes also increased the accuracy of pressure files and estimates for each bay system and gulf area.

For each bay system and gulf area, survey data were summarized first by interview, then by site for each day. Fishing effort in man-hours was determined as the product of number of people fishing and trip length. Harvested fish were tallied by species. Site summaries for each day were adjusted for missed interviews and daylight hours not surveyed, then expanded based on relative pressure values. Adjusted and expanded site summaries were averaged by bay system (or TTS or EEZ gulf area), season, and day type. Mean daily estimates were further expanded to represent seasonal estimates for each day type by multiplying them by the total number of days in each season and day-type combination. Seasonal estimates were determined by combining day-type estimates. Annual estimates were determined by combining season estimates. See Appendix A.2 for more details on calculation of fishing pressure, landings, catch rates, and associated standard error estimates.

Calculation of Mean Lengths and Mean Weights

Prior to 15 May 1983, landings for each fishing party were counted and weighed en masse by species. Beginning 15 May 1983, landings were measured for total length rather than weighed. Total length was measured by compressing the caudal fin lobes dorsoventrally to obtain the maximum possible total length. Standard or fork length measurements were taken when total length measurements were not available.

Mean lengths prior to 15 May 1983 were generated from weight-to-length conversions. Mean weights after 14 May 1983 were generated from length-to-weight conversions. Standard and fork lengths were converted to total lengths with length-to-length conversions. See Appendix A.3 for details on length conversions and Appendix A.4 for details on mean length and mean weight calculations.

Calculation of Other Statistics

Other statistics calculated from survey data included number of days surveyed, number of interviews conducted, number of anglers interviewed, mean fishing party size, mean trip length, composition of "other" species, angler residential origin, species sought, and trip satisfaction. These statistics were based on direct summary of unadjusted and unexpanded interview data. See Appendix A.5 for details on determination of angler residential origin and Appendix A.6 for details on determination of species sought and trip satisfaction.

Calculation of Estimates for Bay and Pass Private-boat Trips Lasting More Than 12 Hours

Although most sport-boat fishing trips encountered with this survey lasted 12 h or less, a considerable number of trips have been intercepted that lasted more than 12 h. These longer trips were undertaken primarily by bay and pass private-boat anglers in the upper Laguna Madre bay system. Trips lasting more than 12 h often included non-fishing activity, such as spending the night in cabins accessible only by boat. Based on a study by Spiller et al. (2000), trip lengths for trips lasting more than 12 h were adjusted downward to eliminate time spent on non-fishing activities.

Interviews of bay and pass private-boat fishing parties on trips lasting more than 12 h were conducted in the same manner as fishing parties on trips lasting 12 h or less. Using methods described above, separate relative pressure files were created for bay and pass private-boat fishing trips lasting more than 12 h. These were used to calculate fishing pressure (effort) and harvest estimates.

Results

Findings included in this report date back to 1974. In the sections below, results are presented primarily in terms of the most recent ten years (1998-2008) and the most recent year (2007-08). Except where noted, results presented below are for daily trips lasting 12 h or less.

All trip-ending parties encountered during surveys were enumerated in some manner based on their boating activity type. Most (77%) of the 19,254 interviews conducted during 2007-08 involved sport-boat fishing (Table 1).

Coastwide Overview

The vast majority of annual coastwide sport-boat fishing pressure and landings occurred in bays and passes during 1983-2008 (Table 2; Figure 2). With the exception of the last three years (2005-06 through 2007-08), pressure and landings were slightly greater in the EEZ than the TTS in most years. Overall, about 6.33 million man-h were expended to land about 1.84 million fish in 2007-08. Private-boat fishing in bays and passes accounted for about 77% of the fishing pressure and about 70% of the landings in 2007-08.

During the 2007-08 survey year, 12,799 marine sport-boat angling parties on trips lasting 12 h or less were interviewed. These included 10,914 private-boat (Appendix B, Table B.1) and

976 party-boat (Appendix C, Table C.1) parties from bays and passes; 551 private-boat (Appendix D, Table D.1) and 39 party-boat (Appendix E, Table E.1) parties from the TTS; and 282 private-boat (Appendix F, Table F.1) and 37 party-boat (Appendix G, Table G.1) parties from the EEZ. An additional 384 private-boat angling parties from bay and pass trips lasting more than 12 h were interviewed during 2007-08 (Appendix H, Table H.1).

Bays and Passes

Private-boat fishing.—Private-boat fishing in bays and passes accounted for about 79% of the annual coastwide fishing pressure and about 72% of the landings during 1998-2008 (Table 2). During 1998-2008, an average of 5.29 million man-h were expended annually to land an average of 1.54 million fish. In 2007-08, about 4.91 million man-h were expended to land about 1.29 million fish (Figure 3; Appendix B, Tables B.2 and B.3). Annual bay and pass private-boat fishing pressure and landings were on average at least three times greater in Galveston Bay system than in any of the other bay systems during 1998-2008 (Figure 4).

More spotted seatrout (42%) were landed annually from bays and passes by private-boat anglers than any other species during 1998-2008 (Figure 5). Large numbers of red drum (13%), sand seatrout (10%), and Atlantic croaker (9%) also were landed. Spotted seatrout, sand seatrout, Atlantic croaker, southern flounder, black drum, and gafftopsail catfish were landed most often from Galveston Bay system; red drum from Aransas Bay system; and sheepshead from Corpus Christi Bay system (Figures 6 and 7). Landings of spotted seatrout, red drum, and black drum were spread more evenly among bay systems than other target species. Fifty-one additional species were landed from bays and passes by private-boat anglers in 2007-08 (Appendix B, Table B.7).

Trends in annual coastwide private-boat landings, catch rates, mean lengths, and mean weights during 1974-2008 are illustrated for the eight bay and pass private-boat target species in Figures 8-15.

After declining and being quite variable in early years, annual coastwide private-boat spotted seatrout landings and catch rates from bays and passes stabilized to around 0.6 million fish and 0.12 fish/man-h during 1992-2008 (Figure 8; Appendix B, Tables B.3 and B.4). Mean lengths and mean weights increased steadily until leveling off in later years (Figure 8). In 2007-08, spotted seatrout averaged 439 mm and 0.84 kg coastwide (Appendix B, Tables B.5 and B.6).

Annual coastwide private-boat red drum landings varied between 150 and 250 thousand fish from 1992-93 to 2007-08 (Figure 9). Mean lengths and mean weights decreased in early years, and then increased steadily until leveling off in later years. A catch rate of 0.05 fish/man-h in 2007-08 matched the previous all-time high from 1974-76. In 2007-08, red drum averaged 590 mm and 2.30 kg coastwide (Appendix B, Tables B.5 and B.6).

Party-boat fishing.—Party-boat fishing in bays and passes accounted for about 13% of the annual coastwide fishing pressure and about 21% of the landings during 1998-2008 (Table 2). During 1998-2008, an average of 0.88 million man-h were expended annually to land an average of 0.44 million fish. Fishing pressure and landings increased steadily and reached all-

time highs of 1.07 million man-h and 0.58 million fish in 2000-01, and varied thereafter (Figure 16; Appendix C, Tables C.2 and C.3). About 70% of the average annual bay and pass party-boat fishing pressure and landings during 1998-2008 occurred in the four bay systems of the lower half of the coast (Figure 17).

Spotted seatrout (73%) dominated annual coastwide party-boat landings from bays and passes during 1998-2008 (Figure 18). Red drum (16%) also were landed in large numbers. Fourteen additional species were landed from bays and passes by party-boat anglers in 2007-08 (Appendix C, Tables C.3 and C.7).

Trends in annual coastwide bay and pass party-boat landings, catch rates, mean lengths, and mean weights for spotted seatrout and red drum during 1974-2008 are illustrated in Figures 19 and 20.

Annual coastwide party-boat landings of spotted seatrout from bays and passes increased dramatically from a low of about 35 thousand fish in 1990-91 to an all-time high of about 438 thousand fish in 2000-01 (Figure 19). Landings declined thereafter with about 271 thousand fish landed in 2007-08. The catch rate declined steadily from 0.51 fish/man-h in 1997-98 to 0.29 fish/man-h in 2007-08 (Appendix C, Table C.4). Mean lengths and mean weights changed little over the years. In 2007-08, spotted seatrout averaged 442 mm and 0.86 kg coastwide (Appendix C, Tables C.5 and C.6).

Annual coastwide party-boat landings of red drum from bays and passes increased over the years from a low of about 6 thousand fish in 1983-84 to an all-time high of about 90 thousand fish in 2006-07 (Figure 20). About 89 thousand fish were landed in 2007-08. Since 1994-95, catch rates varied between 0.06 and 0.09 fish/man-h with 0.09 fish/man-h observed in 2007-08. Mean lengths and mean weights changed little over the years with coastwide estimates of 594 mm and 2.34 kg in 2007-08 (Appendix C, Tables C.5 and C.6).

Texas Territorial Sea

Private-boat fishing.—Private-boat fishing in the TTS accounted for about 3% of the annual coastwide fishing pressure and about 3% of the landings during 1998-2008 (Table 2). During 1998-2008, an average of 230 thousand man-h were expended annually to land an average of 68 thousand fish. Fishing pressure and landings reached all-time highs of 304 thousand man-h and 100 thousand fish in 1996-97 (Figure 21; Appendix D, Tables D.2 and D.3). In 2007-08, about 272 thousand man-h were expended to land about 83 thousand fish. Average annual TTS private-boat fishing pressure (48%) and landings (41%) were greatest offshore of the Galveston Bay system during 1998-2008 (Figure 22).

Spotted seatrout (30%), red snapper (20%), sand seatrout (8%), king mackerel (8%), Spanish mackerel (6%), and red drum (4%) were the most often landed species from TTS private boats during 1998-2008 (Figure 23). Forty-four additional species were landed from the TTS by private-boat anglers in 2007-08 (Appendix D, Tables D.3 and D.7).

Trends in annual coastwide TTS private-boat landings, catch rates, mean lengths, and mean weights during 1982-2008 are illustrated for red snapper and king mackerel in Figures 24 and 25.

Annual coastwide private-boat landings of red snapper from the TTS reached an all-time high of about 22 thousand fish in 2007-08 (Figure 24). Catch rates remained at a high level (0.08 fish/man-h) during 2005-06 through 2007-08 (Appendix D, Table D.4). Mean lengths and mean weights increased steadily over the years to all-time highs of 506 mm and 2.01 kg during 2007-08 (Appendix D, Tables D.5 and D.6).

Annual coastwide private-boat landings of king mackerel from the TTS declined from an all-time high of about 14 thousand fish in 1995-96 and 1996-97 to an all-time low of about 3 thousand fish in 2007-08 (Figure 25). Catch rates declined from 0.6 fish/man-h in 1992-93 to an all-time low of 0.1 fish/man-h in 2007-08. Mean lengths and mean weights changed little over the years. King mackerel averaged 986 mm and 5.21 kg in 2007-08 (Appendix D, Tables D.5 and D.6).

Party-boat fishing.—Party-boat fishing in the TTS accounted for less than 1% of the annual coastwide fishing pressure and less than 1% of the landings during 1998-2009 (Table 2). During 1998-2008, an average of 26 thousand man-h were expended annually to land an average of 10 thousand fish. In 2007-08, about 36 thousand man-h were expended to land about 16 thousand fish (Appendix E, Tables E.2 and E.3). Catch rates, mean lengths, and mean weights are presented in Appendix E, Tables E.4-E.6.

Spotted seatrout (41%), red snapper (21%), king mackerel (10%), and red drum (3%) were the most often landed species from TTS party boats during 1998-2008 (Figure 18). Twenty-four additional species were landed from the TTS by party-boat anglers in 2007-08 (Appendix E, Tables E.3 and E.7).

United States Exclusive Economic Zone

Private-boat fishing.—Private-boat fishing in the EEZ accounted for about 4% of the annual coastwide fishing pressure and about 3% of landings during 1998-2008 (Table 2). During 1998-2008, an average of 246 thousand man-h were expended annually to land an average of 63 thousand fish. Fishing pressure increased from an all-time low of 132 thousand man-h in 1993-94 to an all-time high of about 353 thousand man-h in 1996-97 but decreased to about 145 thousand man-h in 2007-08 (Figure 26; Appendix F, Table F.2). Landings reached an all-time low of about 41 thousand fish in 2007-08 (Figure 26; Appendix F, Table F.3). Average annual EEZ private-boat fishing pressure (51%) and landings (47%) were greatest offshore of the Galveston Bay system during 1998-2008 (Figure 27).

Red snapper (44%), king mackerel (16%), dolphinfish (4%), Atlantic spadefish (4%), gray triggerfish (4%), and Spanish mackerel (3%) were the most often landed species from EEZ private boats during 1998-2008 (Figure 23). Forty-three additional species were landed from the EEZ by private-boat anglers in 2007-08 (Appendix F, Tables F.3 and F.7).

Annual coastwide private-boat landings of red snapper from the EEZ decreased from a high of about 79 thousand fish in 1996-97 to an all-time low of about 16 thousand fish in 2007-08 (Figure 28; Appendix F, Table F.3). The coastwide catch rate decreased from a high of 0.25 fish/man-h in 1995-96 to 0.11 fish/man-h in 2007-08 (Appendix F, Table F.4). Mean lengths and mean weights increased steadily over the years to all-time highs of 479 mm and 1.88 kg during 1998-99, and varied at lower levels thereafter with 465 mm and 1.50 kg observed in 2007-08 (Appendix F, Tables F.5 and F.6).

Annual coastwide private-boat landings of king mackerel from the EEZ varied greatly over the years (Figure 29). In 2007-08, landings matched the all-time low of 4 thousand fish last observed in 1989-90 (Appendix F, Table F.3). Between these lows, landings reached a high of 18 thousand fish in 1997-98. The coastwide catch rate was 0.03 fish/man-h in 2007-08 (Appendix F, Table F.4). Mean lengths and mean weights changed little over the years; however, mean length reached an all-time high of 991 mm (5.45 kg) in 2007-08 (Appendix F, Tables F.5 and F.6).

Party-boat fishing.—Party-boat fishing in the EEZ accounted for about 1% of the annual coastwide fishing pressure and about 1% of landings during 1998-2008 (Table 2). During 1998-2008, an average of 36 thousand man-h were expended annually to land an average of 17 thousand fish. In 2007-08, about 33 thousand man-h were expended to land about 18 thousand fish (Appendix G, Tables G.2 and G.3). Catch rates, mean lengths, and mean weights are presented in Appendix G, Tables G.4-G.6.

Red snapper (48%), king mackerel (21%), and dolphinfish (5%) were the most often landed species from EEZ party boats during 1998-2008 (Figure 18). Nineteen additional species were landed from the EEZ by party-boat anglers in 2007-08 (Appendix G, Tables G.3 and G.7).

Angler Residential Origin

The majority (57%) of annual coastwide bay and pass private-boat anglers resided in coastal counties adjacent to the bay system fished during 1998-2008 (Figure 30; Appendix B, Table B.8). Among bay systems, Galveston (94%) had the greatest proportion of bay and pass private-boat anglers from coastal counties adjacent to the bay system fished; San Antonio (29%) had the greatest proportion from coastal counties not adjacent to the bay system fished; Aransas had the greatest proportion from non-coastal counties (55%), and Corpus Christi had the greatest proportion from other states and countries (14%) (Figure 31).

The residential origin of most annual coastwide bay and pass party-boat anglers during 1998-2008 was almost evenly split between coastal counties adjacent to the bay system fished (36%) and non-coastal counties (40%) (Figure 32; Appendix C, Table C.8). Among bay systems, Galveston had the greatest proportion of bay and pass party-boat anglers from adjacent coastal counties (81%); Sabine Lake had the greatest proportion from coastal counties not adjacent to the bay system fished (37%); Corpus Christi had the greatest proportion from non-coastal counties (57%); and Sabine Lake had the greatest proportion from other states and countries (17%) (Figure 33).

The majority of annual coastwide TTS (56%) and EEZ (63%) private-boat anglers resided in coastal counties adjacent to the area fished during 1998-2008 (Figure 30; Appendix D, Table D.8; Appendix F, Table F.8). Among gulf areas, Galveston had the greatest proportions of TTS and EEZ private-boat anglers from coastal counties adjacent to the area fished (about 90%); Matagorda had the greatest proportion from coastal counties not adjacent to the bay system fished (about 22%); Corpus Christi had the greatest proportion from non-coastal counties (about 57%), and Lower Laguna Madre had the greatest proportion from other states and countries (about 5%) (Figure 34).

The residential origin of most annual coastwide TTS and EEZ party-boat anglers during 1998-2008 was almost evenly split between coastal counties adjacent to the gulf area fished (about 42%) and non-coastal counties (about 41%) (Figure 32; Appendix E, Table E.8; Appendix G, Table G.8). There were differences among gulf areas, but these were less defined due to the small number of anglers encountered (Figure 35).

Species Sought by Anglers

Bay and pass private-boat anglers primarily sought spotted seatrout (18%), red drum (14%), flounder (2%), a combination of spotted seatrout and red drum (38%), or a combination of spotted seatrout, red drum, and flounder (4%) during 1998-2008 (Figure 36; Appendix B, Table B.9). Many anglers sought no particular species (18%).

Bay and pass party-boat anglers primarily sought spotted seatrout (26%), red drum (15%), or a combination of spotted seatrout and red drum (45%) during 1998-2008 (Figure 36; Appendix C, Table C.9). Many anglers sought no particular species (10%).

TTS private-boat anglers primarily sought king mackerel (25%), spotted seatrout (15%), red snapper (9%), red drum (4%), a combination of spotted seatrout and red drum (10%), or a combination of king mackerel and red snapper (2%) during 1998-2008 (Figure 37; Appendix D, Table D.9). Many anglers sought no particular species (23%).

TTS party-boat anglers primarily sought spotted seatrout (19%), king mackerel (11%), red snapper (6%), a combination of spotted seatrout and red drum (22%), or a combination of king mackerel and red snapper (4%) during 1998-2008 (Figure 37; Appendix E, Table E.9). Many anglers sought no particular species (20%).

EEZ private-boat anglers primarily sought red snapper (25%), king mackerel (22%), or a combination of red snapper and king mackerel (8%) during 1998-2008 (Figure 38; Appendix F, Table F.9). Many anglers sought no particular species (26%).

EEZ party-boat anglers primarily sought red snapper (25%), king mackerel (6%), or a combination of red snapper and king mackerel (15%) during 1998-2008 (Figure 38; Appendix G, Table G.9). Many anglers sought no particular species (38%).

Angler Trip Satisfaction

Mean trip satisfaction responses among coastwide bay and pass, TTS, and EEZ private-boat and party-boat anglers trended slightly upward from 1987-88 to 2007-08 (Figures 39-40). For coastwide bay and pass private-boat and party-boat anglers, mean trip satisfaction responses were at all-time highs of 6.1 and 8.1, respectively, in 2007-08 (Appendix B, Table B.10; Appendix C, Table C.10). For coastwide TTS private-boat and party-boat anglers, mean trip satisfaction responses in 2007-08 were 6.7 and 7.9, respectively (Appendix D, Table D.10; Appendix E, Table E.10). For coastwide EEZ private-boat and party-boat anglers, mean trip satisfaction responses in 2007-08 were 6.7 and 8.7, respectively (Appendix F, Table F.10; Appendix G, Table G.10).

Bay and Pass Private-boat Trips Lasting More Than 12 Hours

Coastwide bay and pass private-boat anglers on trips lasting more than 12 h annually expended an average of 217 thousand man-h to land an average of 39 thousand fish during 1998-2008 (Figure 41; Appendix H, Tables H.2 and H.3). The majority of bay and pass private-boat fishing pressure (69%) and landings (67%) from trips lasting more than 12 h occurred in the upper Laguna Madre bay system (Figure 42).

Spotted seatrout (57%), red drum (20%), black drum (9%), and southern flounder (6%) were the most landed species by bay and pass private-boat anglers on trips lasting more than 12 h during 1998-2008 (Figure 43). Coastwide catch rates for spotted seatrout and red drum in 2007-08 were 0.12 and 0.03 fish/man-h, respectively (Appendix H, Table H.4).

During 1998-2008, 47% of annual coastwide bay and pass private-boat anglers on trips lasting more than 12 h resided in coastal counties adjacent to the bay system fished and 38% resided in non-coastal counties (Figure 44; Appendix H, Table H.5). Residential origin of anglers among bay systems is presented in Figure 45.

Supporting Information

Several sources of supporting information were assembled to aid in interpretation of study results.

Sales of recreational fishing licenses in Texas increased steadily from about 0.5 million in 1956 to a high of about 2.0 million in 1983, decreased gradually to about 1.6 million in 2006, and increased to about 1.7 million in 2008 (Figure 46; Appendix I, Tables I.1 and I.2).

Sales of saltwater sportfishing stamps in Texas increased from about 0.4 million in 1986 to an all-time high of about 1.2 million in 2008 (Figure 46; Appendix I, Table I.3).

Texas boat registrations increased from about 0.3 million in 1969 to about 0.6 million in 1981, then remained at that level through 2008 (Figure 46; Appendix I, Table I.3).

The first regulations affecting harvest of saltwater fish by sport anglers in Texas were established in 1955 for flounder, red drum, and spotted seatrout in Cameron, Kenedy, and Willacy Counties (Appendix I, Table I.4). In 2008, the sport harvest of 24 species or species groups was regulated.

Literature sources related to the survey of marine sport fishing in Texas are listed in Appendix J.

Literature sources related to significant environmental events along the Texas coast are listed in Appendix K.

Discussion

Chapter 66 (Fish), Subchapter C (Saltwater Fishing), Section 66.217 (Finfish Research) of the Parks and Wildlife Code directs the Texas Parks and Wildlife Department (TPWD) to conduct continuous research and study of the supply of various species of finfish, including red drum and spotted seatrout (State of Texas 2008). The Texas Marine Sport-Harvest Monitoring Program, subject of this report, and the Texas Marine Resource Monitoring Program (Martinez-Andrade et al. 2005) were designed to comply with this directive. Fishery-dependent and fishery-independent data collected through these programs have been used by the Coastal Fisheries Division of TPWD to manage the coastal fisheries of Texas. Since 1977, size, bag, and/or possession limits were established and/or modified for 25 fish species; game fish status was extended to 14 species and one species group; non-commercial status was extended to 10 species; use of trotlines to take fish was restricted; and use of nets and seines to take fish was restricted, then banned (except for cast nets, dip nets, and minnow seines).

When the sport-harvest monitoring program was initiated (1974-76), boat ramps, wade and bank areas, and lighted commercial piers were surveyed. Budget constraints and difficulties associated with surveying wade and bank areas and lighted commercial piers led to a focus on boat-access sites in subsequent years. The sport-boat portion of the fishery proved more amenable to a long-term monitoring program for assessment of trends in finfish landings.

In addition to its primary purpose, the survey has served as a useful instrument for collection of other fisheries-related data. A social and economic questionnaire was administered to anglers during 1976-78 in cooperation with another state agency to estimate the economic impacts of sport fishing on local and state economies (Texas Department of Water Resources 1980a, 1980b, 1981a, 1981b, 1981c, 1983). Data were collected during 1979-81 to determine whether an enacted size-limit regulation reduced the number of small spotted seatrout retained by anglers (Meador and Green 1986). Private-boat anglers were queried during 1982-83 to determine their short-term fishing avidity (TPWD unpublished data). An ongoing effort to estimate the amount and source of live and dead bait shrimp used by anglers was initiated in 1983 (Osborn and Spiller 1991). Anglers were asked during 1984-87 whether they had fished an oil or gas platform during a portion of their trips (TPWD unpublished data). A social and economic questionnaire with both pre-trip and post-trip questions was administered to anglers during 1987-91 (Green et al. 1991a, 1991b, 1991c). Two elements of this questionnaire, species sought and trip satisfaction, were retained for ongoing application. During the 1993 high-use

season, private-boat anglers were asked to recall the species and number of fish they had caught but not retained in an effort to characterize and estimate bycatch (Campbell and Choucair 1995). Anglers were queried to determine the amount and source of live and dead mullet (*Mugil* sp.) used as bait during 1992-95 and the amount and source of live and dead Atlantic croaker used as bait during 1995-96 and 2002-04 (TPWD unpublished data). Angler compliance with an enacted trophy-tag regulation for retention of over-size red drum was examined during 1994-97 (TPWD unpublished data). Anglers using live or dead fish for bait were queried during 1995-96 to determine types of fish used for bait (Green 2007). During 1995-96, information was collected from angling parties with trip lengths greater than 12 h for adjustment of such trip lengths to obtain comparability with daily trips of 12 h or less (Spiller et al. 2000). In cooperation with the Corpus Christi Bay National Estuary Program, a sportfishing valuation questionnaire was administered to anglers in Aransas, Corpus Christi, and upper Laguna Madre bay systems during 1996-97 (Wellman and Noble 1997). During 2000-01 as part of a seagrass conservation initiative, mailing addresses were collected from interviewed anglers who had fished specific areas in the Aransas, Corpus Christi, and upper Laguna Madre bay systems for a follow-up mail survey (Leitz and Grubbs 2008). A portion of the party-boat interview data collected during 2001-08 was shared with the Gulf States Marine Fisheries Commission to aid in the evaluation of an alternative method for estimating party-boat fishing pressure and landings.

As funds and personnel become available, future efforts should be made to prepare reports on collected data in a timelier manner; improve estimates of party-boat fishing effort and landings, especially for the gulf; and collect additional social and economic data.

Acknowledgements

Many members of the Coastal Fisheries Division field staff conducted numerous interviews of anglers and edited resulting data before and after computer keying. Brenda Bowling, Brian Witt, and David Bennett on the upper coast and Rick Spaw on the lower coast coordinated data submission for computer keying, data editing after keying, and data correction after editing during 2003-08. Jayantika Joshi computer keyed much of the data since 1999. Nancy Ziegler typed most estimates into Appendices B-G tables. Page Campbell prepared the figures. The Texas Parks and Wildlife Department and the United States Fish and Wildlife Service jointly funded this study (DJ 15.605, Project F34M, Segments 20-25).

^a Includes trips ≤ 12 h and trips > 12 h. Also includes interviews from gulf-only surveys beginning in 1992-93.

^b Example: 1983-84 = 15 May 1983 through 14 May 1984.

^c These interviews were combined with private-boat interviews for determination of fishery statistics in this report.

^d Includes fishing for shrimp, crabs, or oysters.

^e Includes fishing for shrimp, crabs, oysters, or fish.

^f Includes interviews missed due to time constraints, incomplete information, refusal, heavy rain, or language barrier.

^a 1=Sabine Lake, 2=Galveston, 3=Matagorda, 4=San Antonio, 5=Aransas, 6=Corpus Christi, 7=Upper Laguna Madre, and 8=Lower Laguna Madre.

^b Parentheses indicate deleted sites.

^c Initially determined from National Oceanic and Atmospheric Administration (NOAA) nautical charts; updated with Global Positioning System hand-held units effective 15 May 1999.

^d A site located in one bay system was designated as a "crossover" site in an adjacent bay system if adjacent-bay-system fishing activity originating from that site represented at least 1% of the adjacent bay system's fishing activity.

Appendix A.2. Calculation of fishing effort, landings, catch rates, and associated standard errors.

Fishing effort (man-hours: number of anglers x trip length) and landings (number of fish in ten species groups: eight target species, "other" species, and all species combined) estimates for private-boat anglers (and separately for party-boat anglers) in bays and passes were calculated for each bay system (8) and temporal stratum (4) [i.e., each combination of season (high-use and low-use) and day type (weekend and weekday)] with the following equation:

$$\hat{F}_{bh} = d_{bh} * \bar{f}_{bh} \quad (1)$$

where \hat{F}_{bh} is the estimated fishing effort or landings in the h th temporal stratum and the b th bay system; d_{bh} is the number of fishable days in the h th temporal stratum and the b th bay system (i.e., does not include days deemed not fishable because of natural disasters like hurricanes, tropical storms, and ice storms) (Table A.2); and \bar{f}_{bh} is the mean daily estimate of fishing effort or landings in the h th temporal stratum and the b th bay system calculated as:

$$\bar{f}_{bh} = \frac{\sum_{n=1}^n \left(\sum_{j=1}^j f_{bhnj} \right) * (y_{bhn})}{n_{bh}} \quad (2)$$

where f_{bhnj} is effort or landings in the j th interview of the n th survey in the h th temporal stratum and the b th bay system; n_{bh} is the number of surveys conducted in the h th temporal stratum and the b th bay system; and y_{bhn} is the expansion factor for the n th survey in the h th temporal stratum and the b th bay system calculated as:

$$y_{bhn} = \frac{s_h * m_{bhn}}{r_{bhi}} \quad (3)$$

where s_h is an upward adjustment for daylight hours not surveyed before 1000 hours and after 1800 hours in the h th temporal stratum; m_{bhn} is an upward or neutral adjustment for interviews missed during the 1000-1800 hours survey period at the n th survey in the h th temporal stratum and the b th bay system; and r_{bhi} is the relative fishing pressure (an upward adjustment) associated with the i th site in the h th temporal stratum and the b th bay system calculated as:

$$r_{bhi} = \frac{\bar{t}_{bhi} * q_{bhi} * v_{bhi}}{\sum_{k=1}^w \left(\bar{t}_{bhi} * q_{bhi} * v_{bhi} \right)} \quad (4)$$

where \bar{t}_{bhi} is the mean number of empty boat trailers and empty but rented wet slips observed at the i th site in the h th temporal stratum and the b th bay system; q_{bhi} is the downward or neutral adjustment for interviewed parties that did not fish in the target bay system at the i th site in the h th temporal stratum and the b th bay system; v_{bhi} is the upward or neutral adjustment for interviewed parties that did not park their empty boat trailer or rent a wet slip at the i th site in the h th temporal stratum and the b th bay system; and w is the total number of sites in the b th bay system.

Standard errors for mean daily estimates of fishing effort and landings were calculated for each bay system and temporal stratum with the following equation:

$$\hat{SE}(\bar{f}_{bh}) = \sqrt{d_{bh}^2 * \hat{\text{var}}(\bar{f}_{bh})} \quad (5)$$

where d_{bh} is the number of fishable days in the h th temporal stratum and the b th bay system (see above); and $\hat{\text{var}}(\bar{f}_{bh})$ is the variance of the mean daily estimate of fishing effort or landings in the h th temporal stratum and the b th bay system calculated as:

$$\hat{\text{var}}(\bar{f}_{bh}) = \frac{\sum_{n=1}^n \left(f_{bhn} - \bar{f}_{bh} \right)^2}{n_{bh} - 1} \quad (6)$$

where n_{bh} is the number of surveys conducted in the h th temporal stratum and the b th bay system; \bar{f}_{bh} is the mean daily estimate of fishing effort or landings in the h th temporal stratum and the b th bay system (see above); and f_{bhn} is the total effort or landings for the n th survey in the h th temporal stratum and the b th bay system calculated as:

$$f_{bhn} = \sum_{j=1}^j f_{bh nj} \quad (7)$$

where $f_{bh nj}$ is effort or landings in the j th interview of the n th survey in the h th temporal stratum and the b th bay system.

Catch rates (number of fish per man-hour) for each of the ten species groups (see above) were calculated for each bay system and temporal stratum with the following equation:

$$\hat{C}_{bh} = \frac{L_{bh}}{E_{bh}} \quad (8)$$

where E_{bh} is fishing effort in the h th temporal stratum and the b th bay system calculated as \hat{F}_{bh} above; and L_{bh} is landings of a given species or species group in the h th temporal stratum and the b th bay system also calculated as \hat{F}_{bh} above.

Standard errors for catch rate estimates were calculated for each bay system and temporal stratum with the following equation derived from Goodman (1960):

$$\hat{SE}(\hat{C}_{bh}) = \frac{1}{E_{bh}^2} \sqrt{\left(L_{bh}^2 * \frac{\hat{\text{var}}(E_{bh})}{n_{bh}} \right) + \left(E_{bh}^2 * \frac{\hat{\text{var}}(L_{bh})}{n_{bh}} \right) - \left(\frac{\hat{\text{var}}(E_{bh}) * \hat{\text{var}}(L_{bh})}{n_{bh}} \right)} \quad (9)$$

where E_{bh} is fishing effort in the h th temporal stratum and the b th bay system; L_{bh} is landings of a given species or species group in the h th temporal stratum and the b th bay system; $\hat{\text{var}}(E_{bh})$ is the variance of E_{bh} calculated as $\hat{\text{var}}(\bar{f}_{bh})$ above; $\hat{\text{var}}(L_{bh})$ is the variance of L_{bh} calculated as $\hat{\text{var}}(\bar{f}_{bh})$ above; and n_{bh} is the number of surveys conducted in the h th temporal stratum and the b th bay system.

Seasonal (high-use and low-use) estimates of fishing effort and landings for each bay system were determined by summing weekend and weekday estimates within each season.

Standard errors for seasonal estimates of fishing effort and landings were calculated by summing weekend and weekday variances and taking the square root [i.e., the variance of the sum is the sum of the variances (Snedecor and Cochran 1967)].

Seasonal catch rates for each of the ten species groups (see above) were calculated for each bay system using seasonal estimates of fishing effort and landings (see equation 8 above).

Standard errors for seasonal catch rate estimates were calculated with the following equation derived from Goodman (1960):

$$\hat{SE}(\hat{C}_{bk}) = \frac{1}{E_{bk}^2} \sqrt{\left[L_{bk}^2 * \left(\frac{\hat{\text{var}}(E_{bk1})}{n_{bk1}} + \frac{\hat{\text{var}}(E_{bk2})}{n_{bk2}} \right) \right] + \left[E_{bk}^2 * \left(\frac{\hat{\text{var}}(L_{bk1})}{n_{bk1}} + \frac{\hat{\text{var}}(L_{bk2})}{n_{bk2}} \right) \right] - \left[\left(\frac{\hat{\text{var}}(E_{bk1})}{n_{bk1}} + \frac{\hat{\text{var}}(E_{bk2})}{n_{bk2}} \right) * \left(\frac{\hat{\text{var}}(L_{bk1})}{n_{bk1}} + \frac{\hat{\text{var}}(L_{bk2})}{n_{bk2}} \right) \right]} \quad (10)$$

where E_{bk} is fishing effort in the k th season and the b th bay system; L_{bk} is landings of a given species or species group in the k th season and the b th bay system; $\hat{\text{var}}(E_{bk1})$ is the variance of E_{bk} on weekends calculated as $\hat{\text{var}}(\bar{f}_{bh})$ above; $\hat{\text{var}}(E_{bk2})$ is the variance of E_{bk} on weekdays calculated as $\hat{\text{var}}(\bar{f}_{bh})$ above; $\hat{\text{var}}(L_{bk1})$ is the variance of L_{bk} on weekends calculated as $\hat{\text{var}}(\bar{f}_{bh})$ above; $\hat{\text{var}}(L_{bk2})$ is the variance of L_{bk} on weekdays calculated as $\hat{\text{var}}(\bar{f}_{bh})$ above; n_{bk1} is the number of weekend surveys conducted in the k th season and the b th bay system; and n_{bk2} is the number of weekday surveys conducted in the k th season and the b th bay system.

Annual estimates of fishing effort and landings, and associated standard errors were determined for each bay system and coastwide in a similar manner as seasonal estimates.

Fishing effort and landings (twenty species groups: eighteen target species, “other” species, and all species combined) estimates for private-boat anglers (and separately for party-boat anglers) in each TTS (5) and EEZ (5) gulf area were calculated with equations analogous to those presented above for each bay system.

Table A.2. —Number of fishable days along the Texas coast (1983-2008).

Survey year ^a	Bay system ^b	Fishable days				Total	Reason for reduction in total days ^g

Appendix A.3. Conversion of standard and fork lengths to total lengths, and conversion of total lengths to whole weights.

Prior to 15 May 1983, landed fish of each species were counted and weighed en masse for each fishing party. According to Osburn and Ferguson (1986), mean total lengths were back calculated using weight-length regressions.

Beginning on 15 May 1983, landed fish of each species from each fishing party were counted and up to six randomly selected specimens were measured for total length to the nearest millimeter. Standard or fork lengths to the nearest millimeter were taken when total lengths were not available. Weights were not taken. Standard and fork lengths were converted to total lengths for determination of mean lengths. Total lengths were converted to whole weights in grams for determination of mean weights.

Mean lengths contained in this report for the 1983-84 through 1997-98 survey years were based on conversion factors listed in Table A.3. In 1999, the database was converted to a relational format. As part of this process, standard and fork lengths were permanently converted to total lengths for selected species. Several different standard-length to total-length conversion factors were used. Mean lengths contained in this report for the 1998-99 through 2007-08 survey years were based on conversion factors listed in Table A.4.

Standard lengths were converted to total lengths with the following equation:

$$TL = a + b(SL) \quad (1)$$

where TL is total length in millimeters; a is the Y-intercept; b is the slope of the regression line; and SL is standard length in millimeters. Values of a and b are listed in Tables A.3 and A.4.

Fork lengths were converted to total lengths with the following equation:

$$TL = c + d(FL) \quad (2)$$

where TL is total length in millimeters; c is the Y-intercept; d is the slope of the regression line; and FL is fork length in millimeters. Values of c and d are listed in Tables A.3 and A.4.

Total lengths were converted to whole weights with the following equation:

$$WW = 10^{[(\log a) + b (\log TL)]} \quad (3)$$

where WW is whole weight in grams; a is the Y-intercept; b is the slope of the regression line; and TL is total length in millimeters. Values of $\log a$ and b are listed in Table A.5.

Appendix A.4. Calculation of mean total lengths, mean whole weights, and associated standard errors.

For data collected after 14 May 1983, mean total lengths and mean whole weights were calculated with the following methods. Fish lengths were obtained during surveys; fish weights were obtained by converting fish lengths.

Mean lengths for target species in each bay system (8) were calculated for each temporal stratum (4) (i.e., each combination of season and day type) with the following equation:

$$\bar{l}_{bh} = \frac{\sum_{i=1}^n l_i}{\sum_{i=1}^n m_i} \quad (1)$$

where \bar{l}_{bh} is the mean length estimate for the h th temporal stratum and the b th bay system; n is the number of surveys conducted; m_i is the number of target fish landed in the i th survey; and l_i is the sum of target fish lengths in the i th survey calculated as:

$$l_i = \left(\sum_{j=1}^{x_i} l_{ij} \right) * \left(\frac{m_i}{x_i} \right) \quad (2)$$

where m_i is the number of target fish landed in the i th survey; x_i is the number of target fish measured in the i th survey; and l_{ij} is the length of the j th target fish measured in the i th survey. The m_i / x_i factor adjusts for target fish that were landed but not measured.

Standard errors for mean lengths in each bay system for each target species were calculated with the following equation:

$$SE_{bh} = \sqrt{\hat{\text{var}}(\bar{l}_{bh})} = \sqrt{\frac{\sum_{i=1}^n \left(l_i - (\bar{l}_{bh})(m_i) \right)^2}{n(n-1)(\bar{m})^2}} \quad (3)$$

where $\hat{\text{var}}(\bar{l}_{bh})$ is the variance of the mean of a single-stage cluster sample [see pages 115-117 in Thompson (1992)]; n is the number of surveys conducted; l_i is sum of target fish lengths in the i th survey (see above); \bar{l} is the mean length of the target species (see above); m_i is the number of fish landed in the i th survey; and \bar{m} is the average number of target fish observed each survey calculated as:

$$\bar{m} = \frac{\sum_{i=1}^n m_i}{n} \quad (4)$$

where m_i is the number of fish landed in the i th survey; and n is the number of surveys conducted. If target fish lengths occur from only one survey day, then the variance and standard error will equal zero [see page 118 in Thompson (1992)].

Annual mean lengths within each bay system (\bar{l}_b) and coastwide (\bar{l}) for each target species were derived from temporal stratum-level estimates (see above) and calculated with the following equations:

$$\bar{l}_b = \frac{\sum_{h=1}^4 (m_{bh})(\bar{l}_{bh})}{\sum_{h=1}^4 m_{bh}} \quad (5)$$

$$\bar{l} = \frac{\sum_{b=1}^8 \sum_{h=1}^4 (m_{bh})(\bar{l}_{bh})}{\sum_{b=1}^8 \sum_{h=1}^4 m_{bh}} \quad (6)$$

where \bar{l}_{bh} is the mean length estimate for the h th temporal stratum and the b th bay system; and m_{bh} is the total number of target fish landed from all surveys in the h th temporal stratum and the b th bay system calculated as:

$$m_{bh} = \sum_{i=1}^n m_{bhi} \quad (7)$$

where n is the number of surveys conducted.

Standard errors for annual mean lengths within each bay system (SE_b) and coastwide (SE) for each target species were derived from temporal stratum-level variances (see above) and calculated with the following equations:

$$SE_b = \sqrt{\hat{\text{var}}(\bar{l}_b)} = \sqrt{\frac{\sum_{h=1}^4 (m_{bh})^2 (\hat{\text{var}}(\bar{l}_{bh}))}{\left(\sum_{h=1}^4 m_{bh}\right)^2}} \quad (8)$$

$$SE = \sqrt{\widehat{\text{var}}(\bar{l})} = \sqrt{\frac{\sum_{b=1}^8 \sum_{h=1}^4 (m_{bh})^2 (\widehat{\text{var}}(\bar{l}_{bh}))}{\left(\sum_{b=1}^8 \sum_{h=1}^4 m_{bh}\right)^2}} \quad (9)$$

where $\widehat{\text{var}}(\bar{l}_{bh})$ is the variance from the h th temporal stratum and the b th bay system; and m_{bh} is the total number of target fish landed from all surveys in the h th temporal stratum and the b th bay system.

Mean lengths for target species in each TTS (5) and EEZ (5) gulf area were calculated with equations analogous to those presented above for each bay system.

Mean weights for target species in each bay system, and in each TTS and EEZ gulf area were calculated with equations analogous to those presented above for mean lengths.

Appendix A.5. Determination of angler residential origin.

Angler residential origin was determined from the angler's county, state, or country of residence. Three categories of angler residential origin were recognized for Texas residents: adjacent coastal counties, non-adjacent coastal counties, and non-coastal counties. A fourth category was recognized for non-Texas residents (i.e., other states and countries).

There are 254 counties in Texas, of which 34 were considered "coastal" (i.e., their boundaries occurred mostly or completely within 80 km of any part of any bay system or gulf area). The remaining 220 counties were considered "non-coastal".

The 34 coastal counties were further subdivided into "adjacent" and "non-adjacent". Adjacent coastal counties occurred mostly or completely within 80 km of any part of the bay system or gulf area fished; non-adjacent coastal counties occurred outside 80 km.

Texas coastal counties considered adjacent to each bay system and gulf area during 1983-2008 are summarized in Table A.6.

Prior to 15 May 1983, the method for determining angler residential origin was slightly different. Instead of determining the residence of each party member, the residence of the boat owner was determined and applied to all party members. Forty-five counties were considered to be "coastal" (i.e., counties having a border within 128 km of the gulf shoreline). "Adjacent" coastal counties for each bay system were defined as "surrounding" (Osburn and Ferguson 1986) the bay system. Texas coastal counties considered adjacent to each bay system during 1974-1983 are summarized in Table A.7.

Appendix A.6. Determination of species sought and trip satisfaction.

Species sought and trip satisfaction were determined by querying one randomly selected angling member of each sport-boat fishing party.

For species sought, the selected angler was asked if he/she had fished for a particular type (or species) of fish that day. If the response was "no", then the angler was considered to have sought no particular species. If the response was "yes", then the angler was asked to name the type (or species) of fish sought.

For trip satisfaction, the selected angler was asked how satisfied he/she was with that day's trip on a scale of 0 to 10 with 0 being the least and 10 being the most. Only whole number responses from 0 to 10 were accepted during the interview.

Species sought and trip satisfaction were first queried during the 1987-88 survey year when a social and economic questionnaire was initiated (Green et al. 1991a, 1991b, 1991c). Species sought was queried in the pre-trip portion of the questionnaire and trip satisfaction was queried in the post-trip portion. When the questionnaire was terminated at the end of the 1990-91 survey year, the species sought and trip satisfaction queries were retained as part of the routine trip-ending interview.

Species sought data from 1987-88 through 1990-91 survey years were collected during pre-trip queries and are not directly comparable to species sought data collected thereafter during trip-ending interviews. For a variety of reasons, the response obtained at the start of a trip may differ from the response obtained at the end of a trip. In addition, data necessary to differentiate angler type (private-boat or party-boat) and angling location (bay and pass, TTS, or EEZ) were not collected during pre-trip queries. Thus, species sought data from the 1987-88 through 1990-91 survey years were summarized separately (Table A.8).

Table A.8.—Percentage of sport-boat^a anglers seeking particular fish species along the Texas coast^b by bay system and year as determined from pre-trip interviews (1987-91).

Appendix B: Private-boat Fishing Estimates for Texas Bays and Passes

Table B.1. Number of days surveyed, number of private-boat interviews, and number of private-boat anglers interviewed in Texas bays and passes by bay system and year (1974-2008)	115
Table B.2. Estimated annual fishing pressure (man-h x 1,000) \pm 1 SE, mean fishing-party size (no. of anglers), and mean trip length (h) for private-boat anglers in Texas bays and passes by bay system and year (1974-2008)	118
Table B.3. Estimated annual landings of fishes (no. x 1,000) \pm 1 SE caught by private-boat anglers in Texas bays and passes by bay system, species, and year (1974-2008)	121
Table B.4. Estimated annual catch rates of fishes (no./man-h) \pm 1 SE caught by private-boat anglers in Texas bays and passes by bay system, species, and year (1974-2008)	130
Table B.5. Estimated annual mean total lengths of fishes (mm/fish) \pm 1 SE caught by private-boat anglers in Texas bays and passes by bay system, species, and year (1983-2008)	139
Table B.6. Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by private-boat anglers in Texas bays and passes by bay system, species, and year (1974-2008)	144
Table B.7. Composition (%) of “other” species caught by private-boat anglers in Texas bays and passes by bay system, year, and species (1983-2008).....	152
Table B.8. Residential origin (%) of private-boat anglers in Texas bays and passes by bay system and year (1974-2008)	188
Table B.9. Species sought (%) by private-boat anglers in Texas bays and passes by bay system and year (1991-2008)	192
Table B.10. Trip satisfaction (%) of private-boat anglers in Texas bays and passes by response scale category, bay system, and year (1987-2008)	199

^aData collected during 1974-76 are not available in comparable format; see Breuer et al. (1977) and Heffernan and Green (1977) for information on these data.

^bDue to rounding of numbers, coastwide totals may not exactly equal sum of bay system totals.

Table B.3.—Estimated annual landings of fishes (no. x 1,000) ± 1 SE caught by private-boat anglers in Texas bays and passes by bay system, species, and year (1974-2008). Blanks indicate no interviews conducted.

Table B.4.—(Cont'd.)

Species Year	Bay system								
	Sabine Lake ^a	Galveston	Matagorda	San Antonio	Aranzas	Corpus Christi	Upper Laguna Madre	Lower Laguna Madre	Coastwide
All species combined ^b 2007-08	0.28 ± 0.05	0.31 ± 0.04	0.25 ± 0.04	0.27 ± 0.04	0.22 ± 0.03	0.24 ± 0.04	0.22 ± 0.03	0.24 ± 0.03	0.26 ± 0.02

^aData collected during 1974-76 are not available in comparable format; see Breuer et al. (1977) and Heffernan and Green (1977) for information on these data.

^bDue to rounding of numbers, these totals may not exactly equal sum of individual totals.

Table B.5.—Estimated annual mean total lengths of fishes (mm/fish) \pm 1 SE caught by private-boat anglers in Texas bays and passes by bay system, species, and year (1983–2008). Blank mean values indicate no fish measured. Blank standard errors indicate fish measured on only one survey day.

Table B.6.—Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by private-boat anglers in Texas bays and passes by bay system, species, and year (1974-2008). Weights after 1982-83 derived from conversion of length measurements. Blank mean values indicate no fish weighed or measured. Blank standard errors indicate fish weighed or measured on only one survey day.

^a Prior to May 1983 all anglers in a fishing party were assigned to the boat owner's residence.

^b Data collected during 1974-76 are not available in comparable format; see Breuer et al. (1977) and Heffernan and Green (1977) for information on these data.

^a Level of trip satisfaction, where 0 = not at all satisfied and 10 = completely satisfied.

Appendix C: Party-boat Fishing Estimates for Texas Bays and Passes

Table C.1. Number of days surveyed, number of party-boat interviews, and number of party-boat anglers interviewed in Texas bays and passes by bay system and year (1983-2008)	206
Table C.2. Estimated annual fishing pressure (man-h x 1,000) \pm 1 SE, mean fishing-party size (no. of anglers), and mean trip length (h) for party-boat anglers in Texas bays and passes by bay system and year (1983-2008)	208
Table C.3. Estimated annual landings of fishes (no. x 1,000) \pm 1 SE caught by party-boat anglers in Texas bays and passes by bay system, species, and year (1983-2008)	210
Table C.4. Estimated annual catch rates of fishes (no./man-h) \pm 1 SE caught by party-boat anglers in Texas bays and passes by bay system, species, and year (1983-2008)	217
Table C.5. Estimated annual mean total lengths of fishes (mm/fish) \pm 1 SE caught by party-boat anglers in Texas bays and passes by bay system, species, and year (1983-2008)	224
Table C.6. Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by party-boat anglers in Texas bays and passes by bay system, species, and year (1983-2008)	229
Table C.7. Composition (%) of “other” species caught by party-boat anglers in Texas bays and passes by bay system, year, and species (1983-2008).....	235
Table C.8. Residential origin (%) of party-boat anglers in Texas bays and passes by bay system and year (1983-2008)	244
Table C.9. Species sought (%) by party-boat anglers in Texas bays and passes by bay system and year (1991-2008)	247
Table C.10. Trip satisfaction (%) of party-boat anglers in Texas bays and passes by response scale category, bay system, and year (1987-2008)	252

Table C.1.—Number of days surveyed, number of part-boat interviews, and number of party-boat anglers interviewed in Texas bays and passes by bay system and year (1983-2008).

^a Due to rounding of numbers, coastwide totals may not exactly equal sum of bay system totals.

Table C.3.—Estimated annual landings of fishes (no. x 1,000) ± 1 SE caught by party-boat anglers in Texas bays and passes by bay system, species, and year (1983-2008). Blanks indicate no interviews conducted.

Table C.5.—Estimated annual mean total lengths of fishes (mm/fish) \pm 1 SE caught by party-boat anglers in Texas bays and passes by bay system, species, and year (1983-2008). Blank mean values indicate no fish measured. Blank standard errors indicate fish measured on only one survey day.

Table C.6.—Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by party-boat anglers in Texas bays and passes by bay system, species, and year (1983-2008). Weights after 1982-83 derived from conversion of length measurements. Blank mean values indicate no fish weighed or measured. Blank standard errors indicate fish weighed or measured on only one survey day.

^a Level of trip satisfaction, where 0 = not at all satisfied and 10 = completely satisfied.

Appendix D: Private-boat Fishing Estimates for the Texas Territorial Sea (TTS)

Table D.1. Number of days surveyed, number of private-boat interviews, and number of private-boat anglers interviewed in the TTS by area and year (1982-2008).....	259
Table D.2. Estimated annual fishing pressure (man-h x 1,000) \pm 1 SE, mean fishing-party size (no. of anglers), and mean trip length (h) for private-boat anglers in the TTS by area and year (1982-2008).....	261
Table D.3. Estimated annual landings of fishes (no. x 1,000) \pm 1 SE caught by private-boat anglers in the TTS by area, species, and year (1982-2008)...	263
Table D.4. Estimated annual catch rates of fishes (no./man-h) \pm 1 SE caught by private-boat anglers in the TTS by area, species, and year (1982-2008)...	276
Table D.5. Estimated annual mean total lengths of fishes (mm/fish) \pm 1 SE caught by private-boat anglers in the TTS by area, species, and year (1983-2008)	289
Table D.6. Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by private-boat anglers in the TTS by area, species, and year (1982-2008)	301
Table D.7. Composition (%) of "other" species caught by private-boat anglers in the TTS by area, year, and species (1983-2008).....	314
Table D.8. Residential origin (%) of private-boat anglers in the TTS by area and year (1982-2008).....	332
Table D.9. Species sought (%) by private-boat anglers in the TTS by area and year (1991-2008).....	335
Table D.10. Trip satisfaction (%) of private-boat anglers in the TTS by response scale category, area, and year (1987-2008).....	341

Table D.1.—Number of days surveyed, number of private-boat anglers interviewed in the TTS by area and year (1982-2008).

^aThis species included in "other" species in this year.^bDue to rounding of numbers, these totals may not exactly equal sum of individual totals.

Table D.5.—Estimated annual mean total lengths of fishes (mm/fish) \pm 1 SE caught by private-boat anglers in the TTS by area, species, and year (1983-2008). Blank mean values indicate no fish measured. Blank standard errors indicate fish measured on only one survey day.

Table D.6.—Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by private-boat anglers in the TTS by area, species, and year (1982-2008). Weights after 1982-83 derived from conversion of length measurements. Blank mean values indicate no fish weighed or measured. Blank standard errors indicate fish weighed or measured on only one survey day.

^a Level of trip satisfaction, where 0 = not at all satisfied and 10 = completely satisfied.

Appendix E: Party-boat Fishing Estimates for the Texas Territorial Sea (TTS)

Table E.1. Number of days surveyed, number of party-boat interviews, and number of party-boat anglers interviewed in the TTS by area and year (1983-2008).....	346
Table E.2. Estimated annual fishing pressure (man-h x 1,000) \pm 1 SE, mean fishing-party size (no. of anglers), and mean trip length (h) for party-boat anglers in the TTS by area and year (1983-2008).....	348
Table E.3. Estimated annual landings of fishes (no. x 1,000) \pm 1 SE caught by party-boat anglers in the TTS by area, species, and year (1983-2008).....	350
Table E.4. Estimated annual catch rates of fishes (no./man-h) \pm 1 SE caught by party-boat anglers in the TTS by area, species, and year (1983-2008).....	363
Table E.5. Estimated annual mean total lengths of fishes (mm/fish) \pm 1 SE caught by party-boat anglers in the TTS by area, species, and year (1983-2008)	376
Table E.6. Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by party-boat anglers in the TTS by area, species, and year (1983-2008)	388
Table E.7. Composition (%) of "other" species caught by party-boat anglers in the TTS by area, year, and species (1983-2008).....	400
Table E.8. Residential origin (%) of party-boat anglers in the TTS by area and year (1983-2008).....	403
Table E.9. Species sought (%) by party-boat anglers in the TTS by area and year (1991-2008).....	406
Table E.10. Trip satisfaction (%) of party-boat anglers in the TTS by response scale category, area, and year (1987-2008).....	412

Table E.1.—Number of days surveyed, number of party-boat interviews, and number of party-boat anglers interviewed in the TTS by area and year (1983-2008).

^aDue to rounding of numbers, these totals may not exactly equal sum of individual totals.

Table E.5.—Estimated annual mean total lengths of fishes (mm/fish) \pm 1 SE caught by party-boat anglers in the TTS by area, species, and year (1983-2008). Blank mean values indicate no fish measured. Blank standard errors indicate fish measured on only one survey day.

Table E.6.—Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by party-boat anglers in the TTS by area, species, and year (1983-2008). Weights derived from conversion of length measurements. Blank mean values indicate no fish weighed or measured. Blank standard errors indicate fish weighed or measured on only one survey day.

Appendix F: Private-boat Fishing Estimates for the U. S. Exclusive Economic Zone (EEZ) off Texas

Table F.1. Number of days surveyed, number of private-boat interviews, and number of private-boat anglers interviewed in the EEZ off Texas by area and year (1982-2008)	417
Table F.2. Estimated annual fishing pressure (man-h x 1,000) \pm 1 SE, mean fishing-party size (no. of anglers), and mean trip length (h) for private-boat anglers in the EEZ off Texas by area and year (1982-2008)	419
Table F.3. Estimated annual landings of fishes (no. x 1,000) \pm 1 SE caught by private-boat anglers in the EEZ off Texas by area, species, and year (1982-2008).....	421
Table F.4. Estimated annual catch rates of fishes (no./man-h) \pm 1 SE caught by private-boat anglers in the EEZ off Texas by area, species, and year (1982-2008).....	434
Table F.5. Estimated annual mean total lengths of fishes (mm/fish) \pm 1 SE caught by private-boat anglers in the EEZ off Texas by area, species, and year (1983-2008).....	447
Table F.6. Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by private-boat anglers in the EEZ off Texas by area, species, and year (1982-2008).....	459
Table F.7. Composition (%) of "other" species caught by private-boat anglers in the EEZ off Texas by area, year, and species (1983-2008)	472
Table F.8. Residential origin (%) of private-boat anglers in the EEZ off Texas by area and year (1982-2008)	494
Table F.9. Species sought (%) by private-boat anglers in the EEZ off Texas by area and year (1991-2008)	497
Table F.10. Trip satisfaction (%) of private-boat anglers in the EEZ off Texas by response scale category, area, and year (1987-2008).....	502

Table F.1.—Number of days surveyed, number of private-boat interviews, and number of private-boat anglers interviewed in the EEZ off Texas by area and year (1982-2008).

^aThis species included in "other" species in this year.^bDue to rounding of numbers, these totals may not exactly equal sum of individual totals.

Table F.5.—Estimated annual mean total lengths of fishes (mm/fish) \pm 1 SE caught by private-boat anglers in the EEZ off Texas by area, species, and year (1983-2008). Blank mean values indicate no fish measured. Blank standard errors indicate fish measured on only one survey day.

Table F.6.—Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by private-boat anglers in the EEZ off Texas by area, species, and year (1982-2008). Weights after 1982-83 derived from conversion of length measurements. Blank mean values indicate no fish weighed or measured. Blank standard errors indicate fish weighed or measured on only one survey day.

^a Level of trip satisfaction, where 0 = not at all satisfied and 10 = completely satisfied.

Appendix G: Party-boat Fishing Estimates for the U. S. Exclusive Economic Zone (EEZ) off Texas

Table G.1. Number of days surveyed, number of party-boat interviews, and number of party-boat anglers interviewed in the EEZ off Texas by area and year (1983-2008)	507
Table G.2. Estimated annual fishing pressure (man-h x 1,000) \pm 1 SE, mean fishing-party size (no. of anglers), and mean trip length (h) for party-boat anglers in the EEZ off Texas by area and year (1983-2008)	509
Table G.3. Estimated annual landings of fishes (no. x 1,000) \pm 1 SE caught by party-boat anglers in the EEZ off Texas by area, species, and year (1983-2008).....	511
Table G.4. Estimated annual catch rates of fishes (no./man-h) \pm 1 SE caught by party-boat anglers in the EEZ off Texas by area, species, and year (1983-2008).....	524
Table G.5. Estimated annual mean total lengths of fishes (mm/fish) \pm 1 SE caught by party-boat anglers in the EEZ off Texas by area, species, and year (1983-2008).....	537
Table G.6. Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by party-boat anglers in the EEZ off Texas by area, species, and year (1983-2008).....	549
Table G.7. Composition (%) of “other” species caught by party-boat anglers in the EEZ off Texas by area, year, and species (1983-2008)	561
Table G.8. Residential origin (%) of party-boat anglers in the EEZ off Texas by area and year (1983-2008)	566
Table G.9. Species sought (%) by party-boat anglers in the EEZ off Texas by area and year (1991-2008).....	569
Table G.10. Trip satisfaction (%) of party-boat anglers in the EEZ off Texas by response scale category, area, and year (1987-2008).....	573

Table G.1.—Number of days surveyed, number of party-boat interviews, and number of party-boat anglers interviewed in the EEZ off Texas by area and year (1983-2008).

Table G.6.—Estimated annual mean whole weights of fishes (kg/fish) \pm 1 SE caught by party-boat anglers in the EEZ off Texas by area, species, and year (1983-2008). Weights derived from conversion of length measurements. Blank mean values indicate no fish weighed or measured. Blank standard errors indicate fish weighed or measured on only one survey day.

Appendix H: Private-boat Fishing Estimates for Trips Lasting More Than 12 Hours in Texas Bays and Passes

Table H.1. Number of days surveyed, number of private-boat interviews, and number of private-boat anglers interviewed for trips lasting more than 12 h in Texas bays and passes by bay system and year (1983-2008)	578
Table H.2. Estimated annual fishing pressure (man-h x 1,000) \pm 1 SE, mean fishing-party size (no. of anglers), and mean adjusted trip length (h) for private-boat anglers on trips lasting more than 12 h in Texas bays and passes by bay system and year (1983-2008)	581
Table H.3. Estimated annual landings of fishes (no. x 1,000) \pm 1 SE caught by private-boat anglers during trips lasting more than 12 h in Texas bays and passes by bay system, species, and year (1983-2008).....	584
Table H.4. Estimated annual catch rates of fishes (no./man-h) \pm 1 SE caught by private-boat anglers during trips lasting more than 12 h in Texas bays and passes by bay system, species, and year (1983-2008).....	593
Table H.5. Residential origin (%) of private-boat anglers on trips lasting more than 12 h in Texas bays and passes by bay system and year (1983-2008)	602

Table H.1.—Number of days surveyed, number of private-boat interviews, and number of private-boat anglers interviewed for trips lasting more than 12 h in Texas bays and passes by bay system and year (1983-2008).

^a Due to rounding of numbers, coastwide totals may not exactly equal sum of bay system totals.

^b Adjustment of trip lengths was based on Spiller et al. (2000).

Table H.3.—Estimated annual landings of fishes (no. x 1,000) ± 1 SE caught by private-boat anglers during trips lasting more than 12 h in Texas bays and passes by bay system, species, and year (1983-2008). Blanks indicate no interviews conducted.

2004	766,796	70,972			566				5,637				1,628,820

^a Example: Fiscal year 1956 = 1 September 1955 through 31 August 1956. Fiscal year 1958 was first year a fishing license was required to fish in Texas salt water.

^b Available to any resident who was legally blind, a qualified disabled veteran, or a licensed resident commercial fisherman. Beginning fiscal year 1996, residents becoming 65 on or after 1 September 1995 were required to obtain this license. Beginning fiscal year 1998, disabled veterans were not eligible for this license. Beginning fiscal year 2003, licensed resident commercial fishermen were not eligible for this license.

^c Numbers are cumulative from year to year.

^d Issued to both residents and non-residents.

^e Includes the "Senior" (age 65 and over) Resident Combination Hunting and Fishing License beginning fiscal year 2001.

^f Includes the "Senior" (age 65 and over) Resident "Super" Combination Hunting and Fishing License beginning fiscal year 2001.

Table 1.2. —Number of recreational fishing licenses sold in Texas by fiscal year (2005-2008).

License type	Fiscal year ^a			
	2005	2006	2007	2008
Resident fishing				
Annual freshwater	423,608	378,395	374,471	403,723
Annual saltwater	104,550	86,292	79,335	75,443
Annual all-water	152,913	116,445	118,951	124,077
July/August freshwater	9,275	8,409	8,313	
July/August saltwater	2,201	2,428	1,781	
July/August all-water	582	597	603	
Day-plus freshwater	57,103	55,308	58,422	
Day-plus saltwater	41,106	46,088	47,073	
Day-plus all-water	687	788	918	
One-day all-water ^b				130,381
Year-from-purchase all-water	91,042	132,782	151,659	188,897

^a Example: Fiscal year 1959 = 1 September 1958 through 31 August 1959.

^b This license is required when using a sport oyster dredge or tongs to take oysters. Referred to as a Sport Oyster Dredge License until fiscal year 1990. Numbers include resident and non-resident versions.

^c This tag is required for sport shrimp trawls used to take shrimp for personal use.

^d This tag was for commercial and non-commercial use until end of fiscal year 2000 when the commercial requirement to obtain the tag was dropped. One tag is required for each 300 ft (91.4 m), or fraction thereof, on all non-commercial trotlines and sail lines.

^e Instantaneous number of boats registered at end of fiscal year.

^f This stamp was first offered for sale on 1 January 1986.

Table 1.4. —Regulations affecting harvest of saltwater fishes by sport anglers in Texas coastal waters (1 September 1955 through 31 August 2008).

Species	Limits				Effective date	Comments
	Minimum length ^a	Maximum length ^a	Daily bag	Possession		
Atlantic tripletail ^b	17 (432)	-	3	6	09-01-2006	
Black drum	14 (356)	30 (762)	5	10	09-01-1988	Retention of one fish longer than 52 in (1,321 mm) allowed per person per day; counted as part of the daily bag and possession limit.
	14 (356)	30 (762)	5	10	09-01-2006	
Blue marlin ^c	114 (2,896)	-	-	-	09-01-1989
