Visiting San Angelo State Park opens a world of exploration to Concho Country waterways, wildlife and Texas history. Please remember to preserve and protect park resources for future generations by following these Leave No Trace principles and regulations:

- Keep Wildlife Wild – Please don't feed or harass wildlife, bison or the cattle
- Trash Your Trash – It's ugly and can make wildlife sick
- Take Only Memories and Pictures – Leave all plants, wildlife, rocks and artifacts
- Be Safe – In case of emergency, know where you are in case you need to call for help
- Protect Your Pets – They must be on a leash no less than six feet and cleaned up after
- Be Kind to Other Visitors – Yield to visitors on horse and watch out for mountain bikers

INTERPRETIVE GUIDE

SAN ANGELO STATE PARK

WATER BRINGS LIFE

The Concho River and its tributaries, such as the North Concho River which flows through San Angelo State Park, spread through the valley like veins, providing the area's lifeblood – water.

Historic Native American groups were drawn to the lush resources of Concho Country but none held the land for extended periods of time. In spring Jumano peoples left their winter home in Texas' Big Bend region for Concho Country to hunt bison, deer and fish the river and tributaries. In the fall they harvested pecans, honey and root plants and returned home in the winter. San Angelo State Park is home to the only known petroglyph (rock carving) sites along the Concho River. Archeologists believe that these petroglyphs were carved 400-800 years ago, possibly by the Kiowa or Comanche.

Early Spanish explorers named the Concho River, Spanish for "shell," after its abundant freshwater mussels, an important food supply. A gift from these mussels are the prized Concho Pearls, unique because of their iridescent light pink to deep purple color.

In 1867, nearby Fort Concho was established to protect area settlers and westward travelers. In 1947, construction began for the lake to help with soil erosion and flood control. In 1975 the lake was named for Ovie Clark Fisher, a U.S. Congressman who served 32 years in the U.S. House of Representatives for Texas' 21st Congressional District. San Angelo State Park opened to the public in 1995.

One of the Texas State Longhorn Herd

TEXAS TREASURES

Proudly roaming the park, a true Texas treasure, part of the Texas State Longhorn Herd represents the independence and hardiness of Texans. They descended from Spanish cattle brought by explorers around the late 1500s. Escapee cattle ventured out on their own and adapted to Texas scrub country by the rule we know as: "survival of the fittest."

After the Civil War, Texas Veterans came home to a state without much of an economy, but millions of free-range Texas Longhorn. Feeding a hungry country after the war, Texans and other cowboys began to rustle up longhorn and drive them north on the nearby Goodnight-Loving Trail to Kansas City for processing. This strengthened the Texas and American economy for several years. As free range began to close off, Texas Longhorn were barb-wired in and bred with other cattle, nearly to the point of extinction. In 1936 Sid Richardson funded Texas historian J. Frank Dobie and Graves Peeler to round up a herd of purebred longhorns. By 1941 he selected 20 longhorn as a base herd. They went to Fort Griffin State Historic Site and later became the official Texas State Longhorn Herd. A portion of the official herd are thriving at San Angelo State Park for all Texans and park visitors to experience.

PERMIAN PAST

Over 250 million years ago during the Permian Period, present day San Angelo State Park looked radically different. All continents were a single, large land mass called Pangea and much of Texas was covered by a shallow sea. The climate was shifting from the mild, wet climate of the "Age of Amphibians" to a hotter, drier one. Reptiles began to expand their ranges and take over the planet.

Synapsids, like dimetrodon, were the predecessors of mammals and also roamed the earth during the Permian Period making tracks and leaving fossils behind. They are thought to have made some of the 26 different trackways in Little Foot Draw of San Angelo State Park around 100 million years before the dinosaurs. Only a few trackways from this time exist around the world. They tell the story of these ancient creatures that came before us. San Angelo State Park staff protect these tracks for future generations to explore.

Dimetrodon may have left tracks in Little Foot Draw.
